10211 Line Driver

High-Speed Dual 3-Input/3-Output NOR Line Driver

FEATURES

- Typical propagation delay: 1.5ns
- Typical supply current ($-I_{EE}$): 30mA

DESCRIPTION

The 10211 is a high-speed dual 3-input/3-output NOR line driver intended to drive up to three transmission lines simultaneously. This feature makes the device particularly useful in clock distribution applications. The 10211 is a higher speed version of the 10111. It is a pin-for-pin replacement for this type. All unused inputs can be left open due to integrated pull-down resistors, which avoid the need for a supply voltage.

ABSOLUTE MAXIMUM RATINGS

SYMBOL	PARAMETER		LIMITS	UNIT
V_{EE}	Supply voltage		-8.0	V
V_{IN}	Input voltage (V_{IN} should never be more negative than V_{EE})		0 to V_{EE}	V
I_O	Output source current (continuous)		-50	mA
T_S	Storage temperature range		-55 to +150	°C
T_J	Maximum junction temperature	Ceramic Package	+165	°C
		Plastic Package	+150	°C

NOTE:

Operation beyond the limits set forth in this table may impair the useful life of the device. Unless otherwise noted, these limits are specified over the operating ambient temperature range.

NOTES:

1. The specified limits represent the worst case values for the parameter. Since these worst case values normally occur at the supply voltage and temperature extremes, additional noise immunity can be achieved by decreasing the allowable operating condition ranges.
2. Conditions for testing shown in the tables are not necessarily worst case. For worst case testing guidelines, refer to DC Testing, Chapter 1, Section 3.
3. The specified limits shown in the DC Electrical Characteristics table can be met only after thermal equilibrium has been established. Thermal equilibrium is established by applying power for at least 2 minutes, while maintaining transverse airflow of 2.5 meters/sec (500 linear feet/min) over the device, mounted either in a test socket or on a printed circuit board. Test voltage values are given in the DC Operating Conditions table.
