

F100171

Triple 4-Input Multiplexer with Enable

General Description

The F100171 contains three 4-input multiplexers which share a common decoder (inputs S_0 and S_1). Output buffer gates provide true and complement outputs. A HIGH on the Enable input ($\bar{E}$) forces all true outputs LOW (see Truth Table). All inputs have 50 k Ω pull-down resistors.

Note 1: Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Parametric values specified at -4.2V to -4.8V .

Note 3: The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

Note 4: Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
