

## F100124 Hex TTL-to-ECL Translator

### General Description

The F100124 is a hex translator, designed to convert TTL logic levels to 100K ECL logic levels. The inputs are compatible with standard or Schottky TTL. A common Enable input (E), when LOW, holds all inverting outputs HIGH and holds all true outputs LOW. The differential outputs allow each circuit to be used as an inverting/non-inverting translator or as a differential line driver. The output levels are voltage compensated.

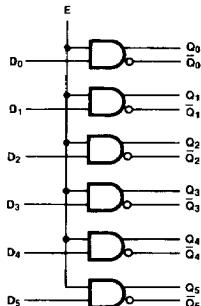

When the circuit is used in the differential mode, the F100124, due to its high common mode rejection, overcomes voltage gradients between the TTL and ECL ground systems. The  $V_{EE}$  and  $V_{TTL}$  power may be applied in either order.

Refer to the F100324 datasheet for:

- PCC packaging
- Lower power
- Military versions
- Extended voltage specs (-4.2V to -5.7V)

Note 1: Absolute maximum ratings are those values beyond which the device may be damaged or have its useful life impaired. Functional operation under these conditions is not implied.

Note 2: Parametric values specified at  $-4.2\text{V}$  to  $-4.8\text{V}$ .

Note 3: The specified limits represent the "worst case" value for the parameter. Since these "worst case" values normally occur at the temperature extremes, additional noise immunity and guard banding can be achieved by decreasing the allowable system operating ranges.

Note 4: Conditions for testing shown in the tables are chosen to guarantee operation under "worst case" conditions.
