

General Description

The AAT351x PowerManager™ products are members of AnalogicTech™'s Total Power Management IC™ product family. This family of Microprocessor Reset Circuits provides the ultimate in versatility, allowing system designers full customization of the μ P monitor and Reset function without any additional components. The AAT351x family offers several combinations of threshold voltage, watchdog timeout period, reset active period and output drive configurations, which are all factory programmed options. All devices are available in 32 reset threshold voltages from 2.6V up to 5V, with three watchdog timeout periods from 6.3ms to 1600ms and three reset timeouts from 1ms up to 140ms. Available output configurations are active low push-pull, active low open drain, active low bi-directional and active high push-pull

The AAT351x family is designed to ignore fast negative transients on V_{DD} and to ensure that Reset outputs remain valid down to 1V.

The AAT351x family is available in the space saving 5-pin SOT23 surface mount package and is specified over the -40 to +85°C temperature range.

Note 1: Over-temperature limits are guaranteed by design, not production tested.

Note 2: This is the minimum time $\overline{RESET}$ must be held low by an external pulldown source to set the active pullup flip-flop.

Note 3: Measured from $\overline{RESET} V_{OL}$ to $(0.8 \times V_{CC})$, Open Circuit Output.

Note 4: Watchdog timeout period C is not available on AAT3513, AAT3514, and AAT3518.

Note 5: WDI is internally serviced within the watchdog period if WDI is left unconnected.

Note 6: The WDI input current is specified as the average input current when the WDI input is driven high or low. The WDI input is designed for a three-stated-output device with a $10\mu\text{A}$ maximum leakage current and capable of driving a maximum capacitive load of 200pF . The three-state device must be able to source and sink at least $200\mu\text{A}$ when active.
