

## FDC633N N-Channel Enhancement Mode Field Effect Transistor

### General Description

This N-Channel enhancement mode power field effect transistors is produced using Fairchild's proprietary, high cell density, DMOS technology. This very high density process is tailored to minimize on-state resistance. These devices are particularly suited for low voltage applications in notebook computers, portable phones, PCMCIA cards, and other battery powered circuits where fast switching, low in-line power loss and resistance to transients are needed in a very small outline surface mount package.

### Features

- 5.2 A, 30 V.  $R_{DS(ON)} = 0.042 \Omega$  @  $V_{GS} = 4.5$  V  
 $R_{DS(ON)} = 0.054 \Omega$  @  $V_{GS} = 2.5$  V.
- SuperSOT™-6 package design using copper lead frame for superior thermal and electrical capabilities.
- High density cell design for extremely low  $R_{DS(ON)}$ .
- Exceptional on-resistance and maximum DC current capability.
