LMP91002

Sensor AFE System: Configurable AFE Potentiostat for Low-Power Chemical Sensing Applications

General Description

The LMP91002 is a programmable Analog Front End (AFE) for use in micro-power electrochemical sensing applications. It provides a complete signal path solution between a not biased gas sensor and a microcontroller generating an output voltage proportional to the cell current. The LMP91002's programmability enables it support not biased electro-chemical gas sensor with a single design. The LMP91002 supports gas sensitivities over a range of 0.5 nA/ppm to 9500 nA/ppm. It also allows for an easy conversion of current ranges from 5µA to 750µA full scale. The LMP91002's transimpedance amplifier (TIA) gain is programmable through the I2C interface. The I2C interface can also be used for sensor diagnostics. The LMP91002 is optimized for micro-power applications and operates over a voltage range of 2.7V to 3.6V. The total current consumption can be less than 10µA. Further power savings are possible by switching off the TIA amplifier and shorting the reference electrode to the working electrode with an internal switch.

Features

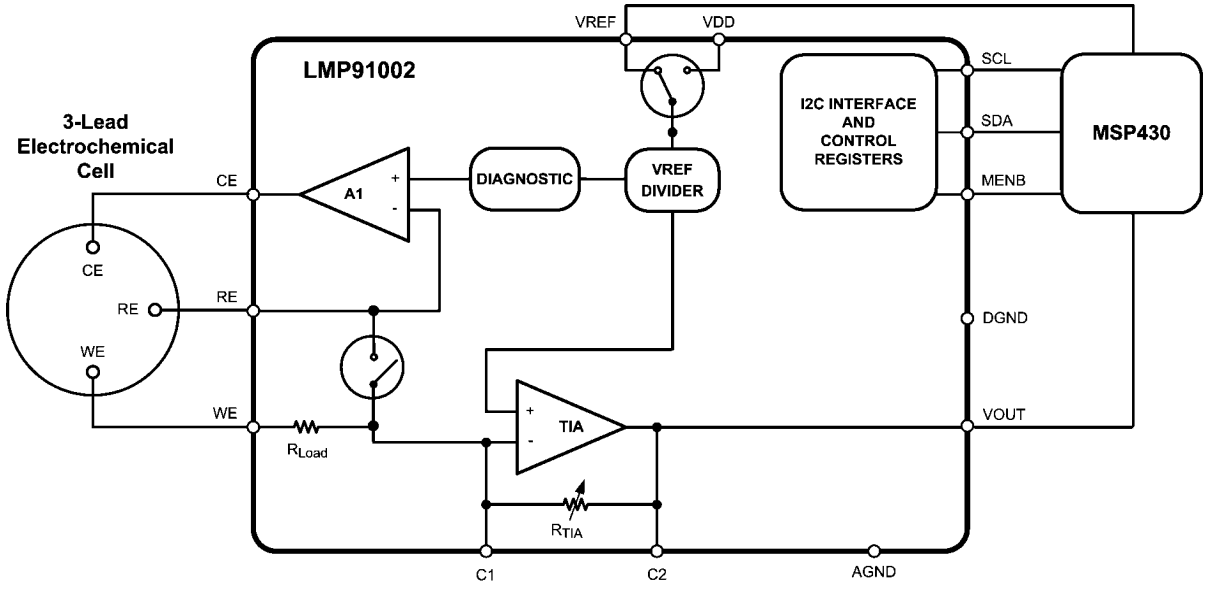
Typical Values, T_A = 25°C

- Supply voltage 2.7 V to 3.6 V
- Supply current (average over time) <10 µA
- Cell conditioning current up to 10 mA
- Reference electrode bias current (85°C) 900pA (max)
- Output drive current 750µA
- Complete potentiostat circuit to interface to most not biased gas sensors
- Low bias voltage drift
- Programmable TIA gain 2.75kΩ to 350kΩ
- I²C compatible digital interface
- Ambient operating temperature -40°C to 85°C
- Package 14 pin LLP
- Supported by Webench Sensor AFE Designer

Applications

- Gas detector
- Amperometric applications
- Electrochemical blood glucose meter

Typical Application



AFE Gas Detector

Pin Descriptions

Pin	Name	Description
1	DGND	Connect to ground
2	MENB	Module Enable, Active Low
3	SCL	Clock signal for I²C compatible interface
4	SDA	Data for I²C compatible interface
5	NC	Not Internally Connected
6	VDD	Supply Voltage
7	AGND	Ground
8	VOUT	Analog Output
9	C2	External filter connector (Filter between C1 and C2)
10	C1	External filter connector (Filter between C1 and C2)
11	VREF	Voltage Reference input
12	WE	Working Electrode. Output to drive the Working Electrode of the chemical sensor
13	RE	Reference Electrode. Input to drive Counter Electrode of the chemical sensor
14	CE	Counter Electrode. Output to drive Counter Electrode of the chemical sensor
	DAP	Connect to AGND

Absolute Maximum Ratings (Note 1)

If Military/Aerospace specified devices are required, please contact the Texas Instruments Sales Office/ Distributors for availability and specifications.

ESD Tolerance (Note 2)	
Human Body Model	2kV
Charge-Device Model	1kV
Machine Model	200V
Voltage between any two pins	6.0V
Current through VDD or VSS	50mA
Current sunk and sourced by CE pin	10mA
Current out of other pins(Note 3)	5mA
Storage Temperature Range	-65°C to 150°C
Junction Temperature (Note 4)	150°C

$t_{SU;STA}$	Set-up time for a repeated START condition		**4.7**			µs
$t_{HD;DAT}$	Data hold time(Note 12)		**0**			ns
$t_{SU;DAT}$	Data Setup time		**250**			ns

Symbol	Parameter	Conditions	Min	Typ	Max	Units
t_f	SDA fall time (*Note 13*)	IL ≤ 3mA; CL ≤ 400pF			**250**	ns
$t_{SU;STO}$	Set-up time for STOP condition		**4.0**			µs
t_{BUF}	Bus free time between a STOP and START condition		**4.7**			µs
$t_{VD;DAT}$	Data valid time				**3.45**	µs
$t_{VD;ACK}$	Data valid acknowledge time				**3.45**	µs
t_{SP}	Pulse width of spikes that must be suppressed by the input filter(*Note 13*)				**50**	ns
t_timeout	SCL and SDA Timeout		**25**		**100**	ms
$t_{EN;START}$	I²C Interface Enabling		**600**			ns
$t_{EN;STOP}$	I²C Interface Disabling		**600**			ns
$t_{EN;HIGH}$	time between consecutive I²C interface enabling and disabling		**600**			ns

Note 1: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Operating Ratings is not implied. Operating Ratings indicate conditions at which the device is functional and the device should not be operated beyond such conditions.

Note 2: Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).

Note 3: All non-power pins of this device are protected against ESD by snapback devices. Voltage at such pins will rise beyond absmax if current is forced into pin.

Note 4: The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA}, and the ambient temperature, T_A. The maximum allowable power dissipation at any ambient temperature is $P_{DMAX} = (T_{J(MAX)} - T_A)/\theta_{JA}$ All numbers apply for packages soldered directly onto a PC board.

Note 5: Electrical Table values apply only for factory testing conditions at the temperature indicated. Factory testing conditions result in very limited self-heating of the device such that $T_J = T_A$. No guarantee of parametric performance is indicated in the electrical tables under conditions of internal self-heating where $T_J > T_A$. Absolute Maximum Ratings indicate junction temperature limits beyond which the device may be permanently degraded, either mechanically or electrically.

Note 6: Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.

Note 7: Limits are 100% production tested at 25°C. Limits over the operating temperature range are guaranteed through correlations using statistical quality control (SQC) method.

Note 8: Offset voltage temperature drift is determined by dividing the change in VOS at the temperature extremes by the total temperature change.

Starting from the measured voltage offset at temperature T1 ($V_{OS_RW}(T1)$), the voltage offset at temperature T2 ($V_{OS_RW}(T2)$) is calculated according the following formula: $V_{OS_RW}(T2)=V_{OS_RW}(T1)+ABS(T2–T1)* TcV_{OS_RW}$.

Note 9: At such currents no accuracy of the output voltage can be expected.

Note 10: This parameter includes both A1 and TIA's noise contribution.

Note 11: In case of external reference connected, the noise of the reference has to be added.

Note 12: LMP91002 provides an internal 300ns minimum hold time to bridge the undefined region of the falling edge of SCL.

Note 13: This parameter is guaranteed by design or characterization.

Function Description

GENERAL

The LMP91002 is a programmable AFE for use in micropower chemical sensing applications. The LMP91002 is designed for 3-lead not biased gas sensors and for 2 leads galvanic cell. This device provides all of the functionality for detecting changes in gas concentration based on a delta current at the working electrode. The LMP91002 generates an output voltage proportional to the cell current. Transimpedance gain is user programmable through an I²C compatible interface from 2.75kΩ to 350kΩ making it easy to convert current ranges from 5µA to 750µA full scale. Optimized for micro-power applications, the LMP91002 AFE works over a voltage range of 2.7V to 3.6 V. The cell voltage is user selectable using the on board programmability. In addition, it is possible to connect an external transimpedance gain resistor. Depending on the configuration, total current consumption for the device can be less than 10µA. For power savings, the transimpedance amplifier can be turned off and instead a load impedance equivalent to the TIA's inputs impedance is switched in.

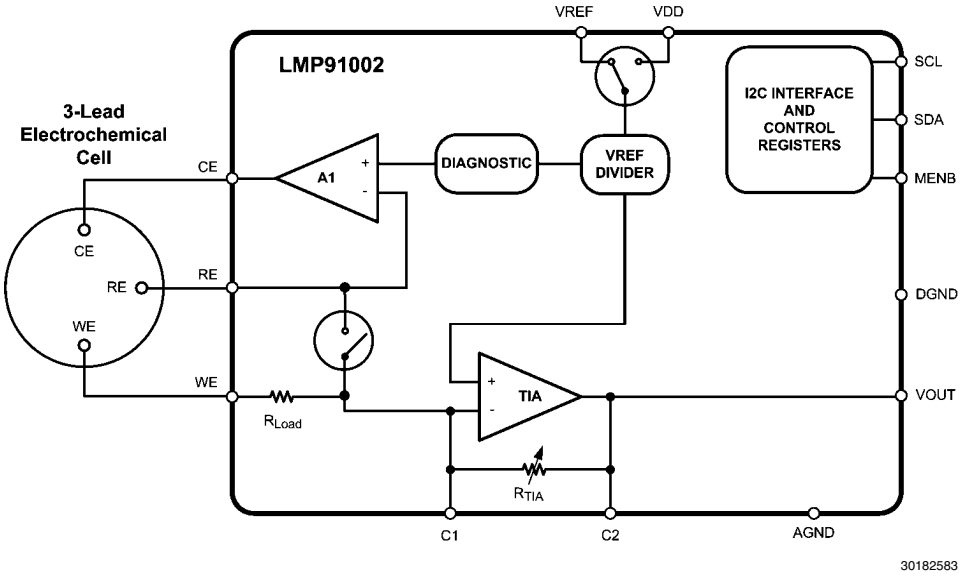

FIGURE 2. System Block Diagram

POTENTIOSTAT CIRCUITRY

The core of the LMP91002 is a potentiostat circuit. It consists of a differential input amplifier used to compare the potential between the working and reference electrodes to a zero bias potential.. The error signal is amplified and applied to the counter electrode (through the **Control Amplifier** - **A1**). Any changes in the impedance between the working and reference electrodes will cause a change in the voltage applied to the counter electrode, in order to maintain the constant voltage between working and reference electrodes. A **Transimpedance Amplifier** connected to the working electrode, is used to provide an output voltage that is proportional to the cell current. The working electrode is held at virtual ground (**Internal ground**) by the transimpedance amplifier. The potentiostat will compare the reference voltage to the desired bias potential and adjust the voltage at the counter electrode to maintain the proper working-to-reference voltage.

Transimpedance amplifier

The transimpedance amplifier (TIA in *Figure 2*) has 7 programmable internal gain resistors. This accommodates the full scale ranges of most existing sensors. Moreover an external gain resistor can be connected to the LMP91002 between C1 and C2 pins. The gain is set through the I²C interface.

Control amplifier

The control amplifier (A1 op amp in *Figure 2*) provides initial charge to the sensor. A1 has the capability to drive up to 10-mA into the sensor in order to to provide a fast initial conditioning. A1 is able to sink and source current according to the connected gas sensor (reducing or oxidizing gas sensor). It can be powered down to reduce system power consumption. However powering down A1 is not recommended, as it may take a long time for the sensor to recover from this situation.

Internal zero

The internal Zero is the voltage at the non-inverting pin of the TIA. The internal zero can be programmed to be either 67%, 50% or 20%, of the supply, or the external reference voltage. This provides both sufficient headroom for the counter electrode of the sensor to swing, in case of sudden changes in the gas concentration, and best use of the ADC's full scale input range.

The Internal zero is provided through an internal voltage divider (Vref divider box in *Figure 2*). The divider is programmed through the I²C interface.

I²C INTERFACE

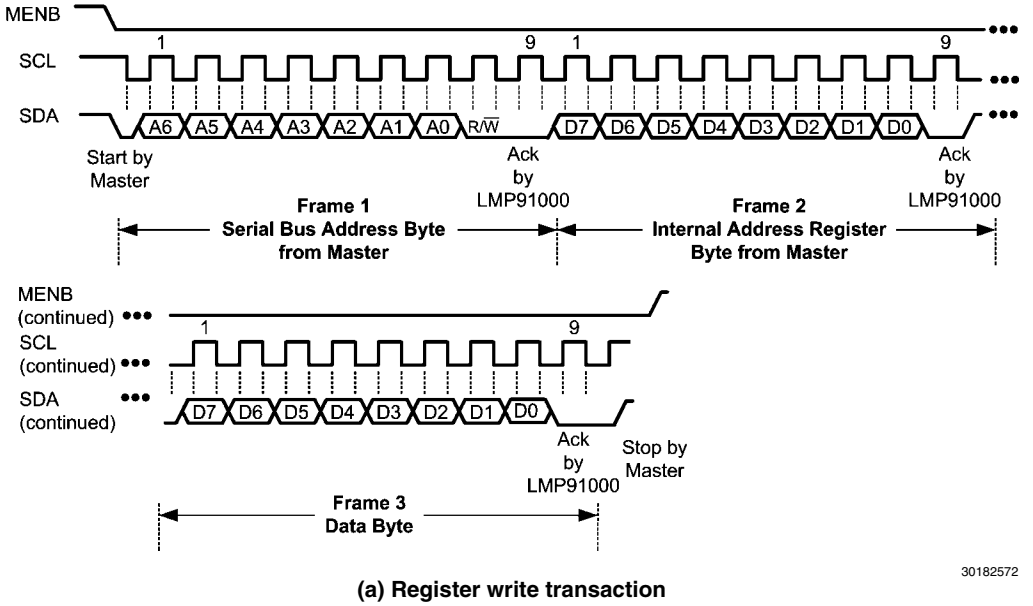
The I²C compatible interface operates in Standard mode (100kHz). Pull-up resistors or current sources are required on the SCL and SDA pins to pull them high when they are not being driven low. A logic zero is transmitted by driving the output low. A logic high is transmitted by releasing the output and allowing it to be pulled-up externally. The appropriate pull-up resistor values will depend upon the total bus capacitance and operating speed. The LMP91002 comes with a 7 bit bus fixed address: 1001 000.

WRITE AND READ OPERATION

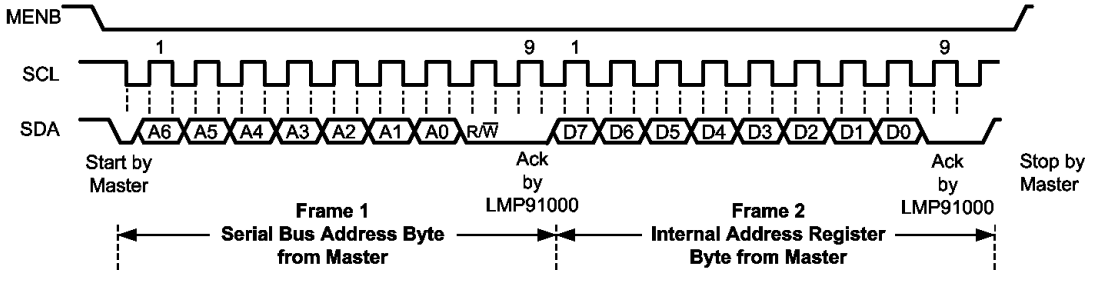
In order to start any read or write operation with the LMP91002, MENB needs to be set low during the whole communication. Then the master generates a start condition by driving SDA from high to low while SCL is high. The start condition is always followed by a 7-bit slave address and a Read/Write bit. After these 8 bits have been transmitted by the master, SDA is released by the master and the LMP91002 either ACKs or NACKs the address. If the slave address matches, the LMP91002 ACKs the master. If the address doesn't match, the LMP91002 NACKs the master. For a write operation, the master follows the ACK by sending the 8-bit register address pointer. Then the LMP91002 ACKs the transfer by driving SDA low. Next, the master sends the 8-bit data to the LMP91002. Then the LMP91002 ACKs the transfer by driving SDA low. At this point the master should generate a stop condition and optionally set the MENB at logic high level (refer to *Figure 3*).

A read operation requires the LMP91002 address pointer to be set first, also in this case the master needs setting at low logic level the MENB, then the master needs to write to the device and set the address pointer before reading from the desired register. This type of read requires a start, the slave address, a write bit, the address pointer, a Repeated Start (if appropriate), the slave address, and a read bit (refer to *Figure 3*). Following this sequence, the LMP91002 sends out the 8-bit data of the register.

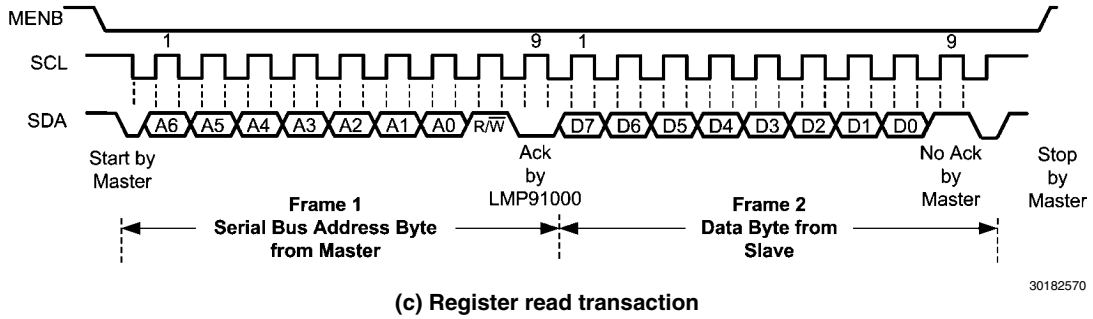
When just one LMP91002 is present on the I²C bus the MENB can be tied to ground (low logic level).



(a) Register write transaction



(b) Pointer set transaction



(c) Register read transaction

FIGURE 3. READ and WRITE transaction

TIMEOUT FEATURE

The timeout is a safety feature to avoid bus lockup situation. If SCL is stuck low for a time exceeding t_timeout, the LMP91002 will automatically reset its I²C interface. Also, in the case the LMP91002 hangs the SDA for a time exceeding t_timeout, the LMP91002's I²C interface will be reset so that the SDA line will be released. Since the SDA is an open-drain with an external resistor pull-up, this also avoids high power consumption when LMP91002 is driving the bus and the SCL is stopped.

REGISTERS

The registers are used to configure the LMP91002.

If writing to a reserved bit, user must write only 0. Readback value is unspecified and should be discarded.

Register map

Address	Name	Power on default	Access	Lockable?
0x00	STATUS	0x00	Read only	N
0x01	LOCK	0x01	R/W	N
0x02 through 0x09	RESERVED			
0x10	TIACN	0x03	R/W	Y
0x11	REFCN	0x20	R/W	Y
0x12	MODECN	0x00	R/W	N
0x13 through 0xFF	RESERVED			

STATUS -- Status Register (address 0x00)

The status bit is an indication of the LMP91002's power-on status. If its readback is "0", the LMP91002 is not ready to accept other I²C commands.

Bit	Name	Function
[7:1]	RESERVED	
0	STATUS	Status of Device **0 Not Ready (default)** 1 Ready

LOCK -- Protection Register (address 0x01)

The lock bit enables and disables the writing of the TIACN and the REFCN registers. In order to change the content of the TIACN and the REFCN registers the lock bit needs to be set to "0".

Bit	Name	Function
[7:1]	RESERVED	
0	LOCK	Write protection 0 Registers 0x10, 0x11 in write mode **1 Registers 0x10, 0x11 in read only mode (default)**

TIACN -- TIA Control Register (address 0x10)

The parameters in the TIA control register allow the configuration of the transimpedance gain (R_{TIA}).

Bit	Name	Function
[7:5]	RESERVED	RESERVED
[4:2]	TIA_GAIN	TIA feedback resistance selection **000 External resistance (default)** 001 2.75kΩ 010 3.5kΩ 011 7kΩ 100 14kΩ 101 35kΩ 110 120kΩ 111 350kΩ
[1:0]	RESERVED	RESERVED

REFCN -- Reference Control Register (address 0x11)

The parameters in the Reference control register allow the configuration of the Internal zero, and Reference source. When the Reference source is external, the reference is provided by a reference voltage connected to the VREF pin. In this condition the Internal Zero is defined as a percentage of VREF voltage instead of the supply voltage.

Bit	Name	Function
7	REF_SOURCE	Reference voltage source selection **0 Internal (default)** 1 external
[6:5]	INT_Z	Internal zero selection (Percentage of the source reference) 00 20% **01 50% (default)** 10 67%
[4]	RESERVED	RESERVED
[3:0]	DIAGNOSTIC	Diagnostic step (Percentage of the source reference) **0000 0% (default)** 0001 1%

MODECN -- Mode Control Register (address 0x12)

The Parameters in the Mode register allow the configuration of the Operation Mode of the LMP91002.

Bit	Name	Function
7	FET_SHORT	Shorting FET feature **0 Disabled (default)** 1 Enabled
[6:3]	RESERVED	RESERVED
[2:0]	OP_MODE	Mode of Operation selection **000 Deep Sleep (default)** 010 Standby 011 3-lead amperometric cell

GAS SENSOR INTERFACE

The LMP91002 supports both 3-lead and 2-lead gas sensors. Most of the toxic gas sensors are amperometric cells with 3 leads (Counter, Worker and Reference). These leads should be connected to the LMP91002 in the potentiostat topology.

3-lead Amperometric Cell In Potentiostat Configuration

Most of the amperometric cell have 3 leads (Counter, Reference and Working electrodes). The interface of the 3-lead gas sensor to the LMP91002 is straightforward, the leads of the gas sensor need to be connected to the namesake pins of the LMP91002.

The LMP91002 is then configured in 3-lead amperometric cell mode; in this configuration the Control Amplifier (A1) is ON and provides the internal zero voltage and bias in case of biased gas sensor. The transimpedance amplifier (TIA) is ON, it converts the current generated by the gas sensor in a voltage, according to the transimpedance gain:

Gain=R_{TIA}

If different gains are required, an external resistor can be connected between the pins C1 and C2. In this case the internal feedback resistor should be programmed to “external”. The R_{Load} together with the output capacitance of the gas sensor acts as a low pass filter.

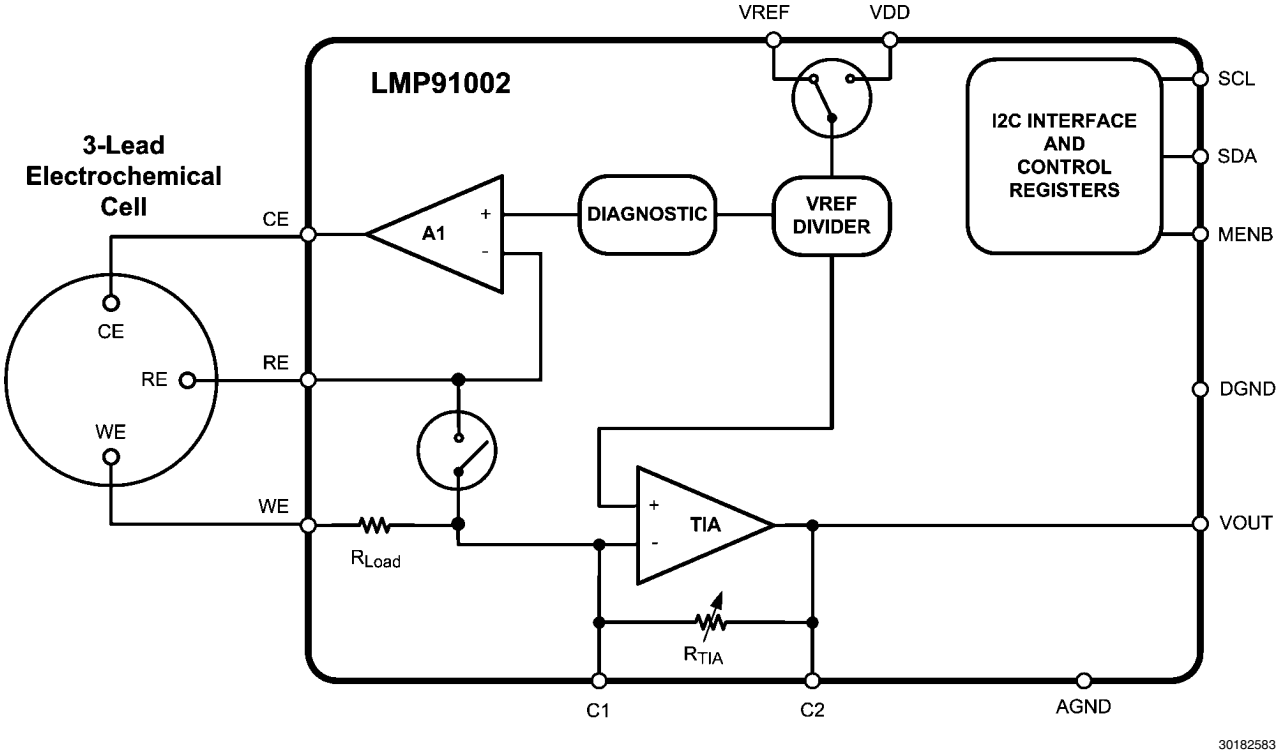


FIGURE 4. 3-Lead Amperometric Cell

2-lead Galvanic Cell in Potentiostat Configuration

When the LMP91002 is interfaced to a galvanic cell (for instance to an Oxygen gas sensor) referred to a reference, the Counter and the Reference pin of the LMP91002 are shorted together and connected to negative electrode of the galvanic cell. The positive electrode of the galvanic cell is then connected to the Working pin of the LMP91002.

The LMP91002 is then configured in 3-lead amperometric cell mode (as for amperometric cell). In this configuration the Control Amplifier (A1) is ON and provides the internal zero voltage. The transimpedance amplifier (TIA) is also ON, it converts the current generated by the gas sensor in a voltage, according to the transimpedance gain:

Gain= R_{TIA}

If different gains are required, an external resistor can be connected between the pins C1 and C2. In this case the internal feedback resistor should be programmed to “external”.

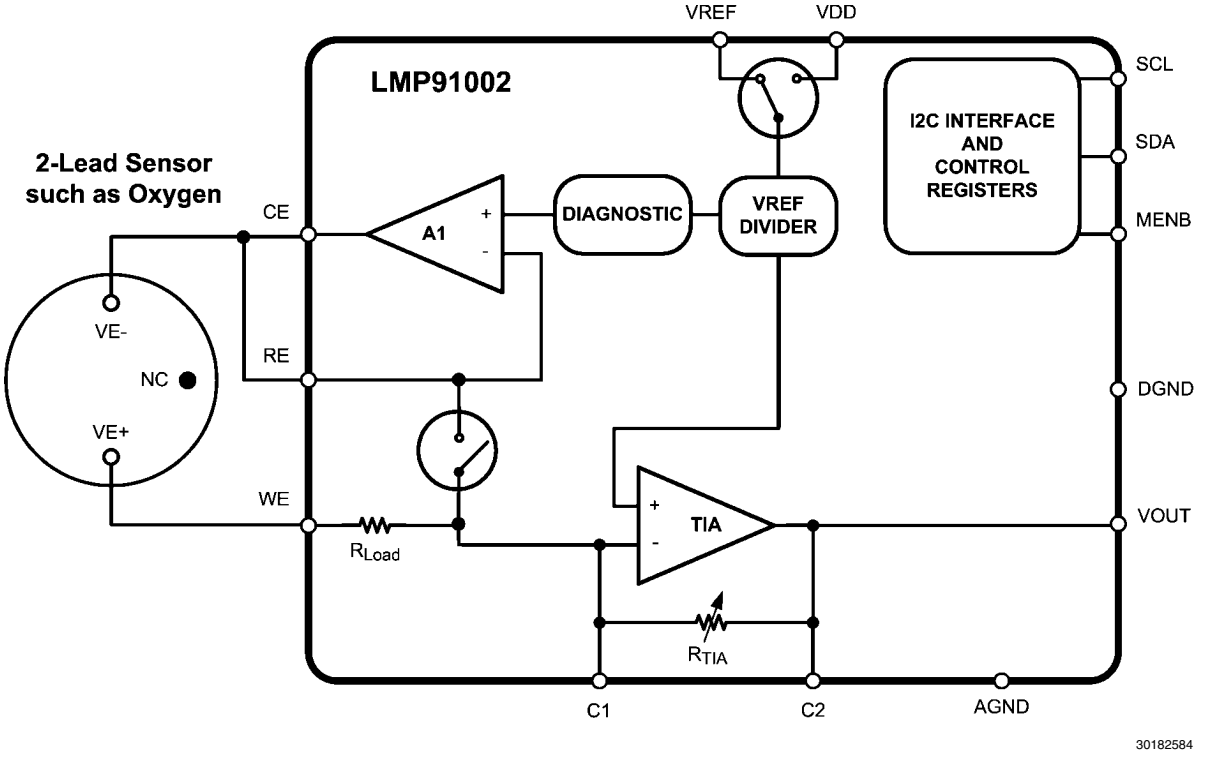

FIGURE 5.

Application Information

CONNECTION OF MORE THAN ONE LMP91002 TO THE I²C BUS

The LMP91002 comes out with a unique and fixed I²C slave address. It is still possible to connect more than one LMP91002 to an I²C bus and select each device using the MENB pin. The MENB simply enables/disables the I²C communication of the LMP91002. When the MENB is at logic level low all the I²C communication is enabled, it is disabled when MENB is at high logic level.

In a system based on a µcontroller and more than one LMP91002 connected to the I²C bus, the I²C lines (SDA and SCL) are shared, while the MENB of each LMP91002 is connected to a dedicate GPIO port of the µcontroller.

The µcontroller starts communication asserting one out of N MENB signals where N is the total number of LMP91002s connected to the I²C bus. Only the enabled device will acknowledge the I²C commands. After finishing communicating with this particular LMP91002, the microcontroller de-asserts the corresponding MENB and repeats the procedure for other LMP91002s. *Figure 6* shows the typical connection when more than one LMP91002 is connected to the I²C bus.

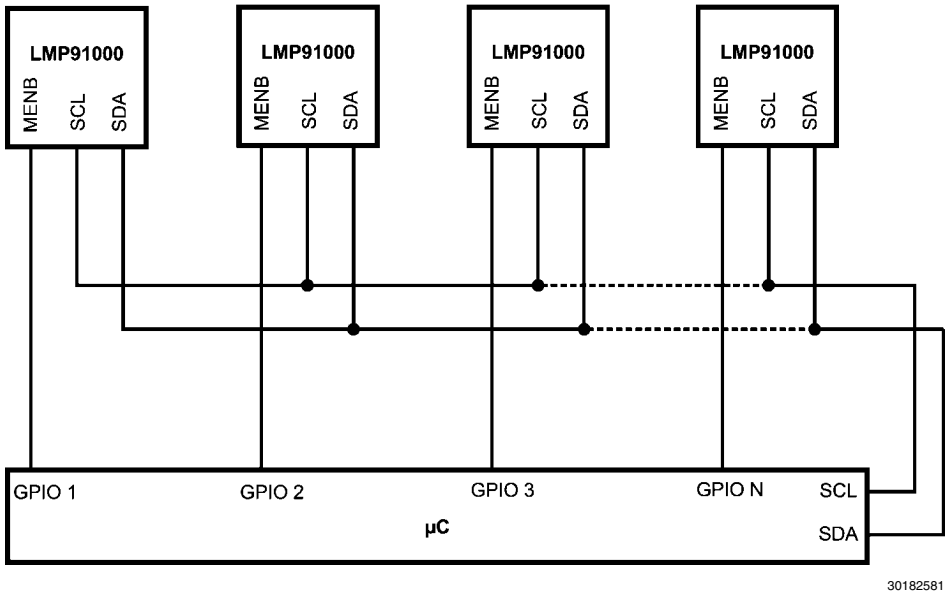

FIGURE 6. More than one LMP91002 on I²C bus

SMART GAS SENSOR ANALOG FRONT END

The LMP91002 together with an external EEPROM represents the core of a SMART GAS SENSOR AFE. In the EEPROM it is possible to store the information related to the GAS sensor type, calibration and LMP91002's configuration (content of registers 10h, 11h, 12h). At startup the microcontroller reads the EEPROM's content and configures the LMP91002. A typical smart gas sensor AFE is shown in *Figure 7*. The connection of MENB to the hardware address pin A0 of the EEPROM allows the microcontroller to select the LMP91002 and its corresponding EEPROM when more than one smart gas sensor AFE is present on the I²C bus. Note: only EEPROM I²C addresses with A0=0 should be used in this configuration.

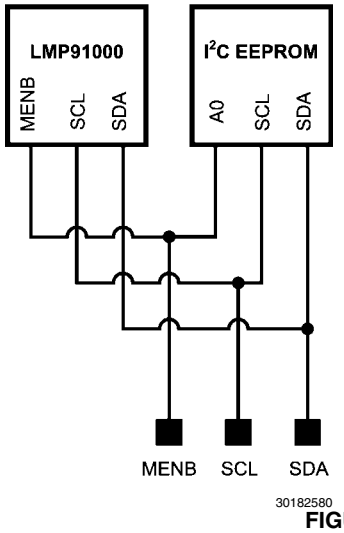

FIGURE 7. SMART GAS SENSOR AFE

SMART GAS SENSOR AFES ON I²C BUS

The connection of Smart gas sensor AFEs on the I²C bus is the natural extension of the previous concepts. Also in this case the microcontroller starts communication asserting 1 out of N MENB signals where N is the total number of smart gas sensor AFE connected to the I²C bus. Only one of the devices (either LMP91002 or its corresponding EEPROM) in the smart gas sensor AFE enabled will acknowledge the I²C commands. When the communication with this particular module ends, the microcontroller de-asserts the corresponding MENB and repeats the procedure for other modules. *Figure 8* shows the typical connection when several smart gas sensor AFEs are connected to the I²C bus.

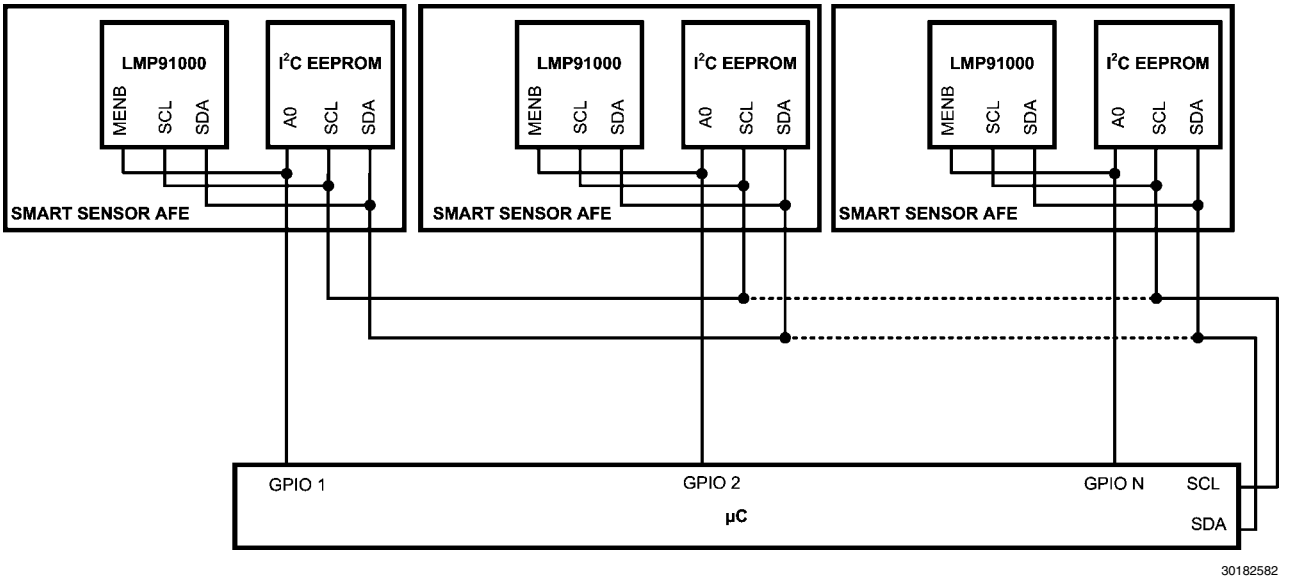

FIGURE 8. SMART GAS SENSOR AFEs on I²C bus

POWER CONSUMPTION

The LMP91002 is intended for use in portable devices, so the power consumption is as low as possible in order to guarantee a long battery life. The total power consumption for the LMP91002 is below 10µA @ 3.3v average over time, (this excludes any current drawn from any pin). A typical usage of the LMP91002 is in a portable gas detector and its power consumption is summarized in the *Power Consumption Scenario* table. This has the following assumptions:

-Power On only happens a few times over life, so its power consumption can be ignored

-Deep Sleep mode is not used

-The system is used about 8 hours a day, and 16 hours a day it is in Standby mode.

This results in an average power consumption of approximately 7.8 µA. This can potentially be further reduced, by using the Standby mode between gas measurements. It may even be possible, depending on the sensor used, to go into deep sleep for some time between measurements, further reducing the average power consumption.

Power Consumption Scenario

	Deep Sleep	StandBy	3-Lead Amperometric Cell	Total
Current consumption (µA) typical value	0.6	6.5	10	
Time ON (%)	0	60	39	
Average (µA)	0	3.9	3.9	7.8
Notes				
A1	OFF	ON	ON	
TIA	OFF	OFF	ON	
I²C interface	ON	ON	ON	

SENSOR TEST PROCEDURE

The LMP91002 has all the hardware and programmability features to implement some test procedures. The purpose of the test procedure is to:

a) test proper function of the sensor (status of health)

b) test proper connection of the sensor to the LMP91002

The test procedure is very easy. The diagnostic block is user programmable through the digital interface. A step voltage can be applied by the end user to the positive input of A1. As a consequence a transient current will start flowing into the sensor (to charge its internal capacitance) and it will be detected by the TIA. If the current transient is not detected, either a sensor fault or a connection problem is present. The slope and the aspect of the transient response can also be used to detect sensor aging (for example, a cell that is drying and no longer efficiently conducts the current). After it is verified that the sensor is working properly, the LMP91002 needs to be reset to its original configuration. It is not required to observe the full transient in order to contain the testing time. All the needed information are included in the transient slopes (both edges). *Figure 9* shows an example of the test procedure, a Carbon Monoxide sensor is connected to the LMP91002, a 25mVpp pulse is applied between Reference and Working pin.

The following procedure shows how to implement the sensor test:

Preliminary conditions:

The LMP91002 is unlocked and it is in 3-Lead Amperometric Cell Mode

1. Put in the [3:0] bit of the register REFCN (0x11) the 0001b value, leaving the other bit unchanged.
   This operation will apply a potential (V_{RW}) between RE and WE pin (V_{RE}>V_{WE}), V_{RW}=1% Source reference
2. Put in the [3:0] bit of the register REFCN (0x11) the 0000b value, leaving the other bit unchanged.
   This operation will remove the potential (V_{RW}) between RE and WE pin (V_{RE}>V_{WE}), V_{RW}=0V.

The width of the pulse is simply the time between the two writing operation.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
