

## **DD28F032SA**

### **32-MBIT (2 MBIT X 16, 4 MBIT X 8)**

### **FlashFile™ MEMORY**

- **User-Selectable 3.3V or 5V V<sub>CC</sub>**
- **User-Configurable x8 or x16 Operation**
- **70 ns Maximum Access Time**
- **28.6 MB/sec Burst Write Transfer Rate**
- **1 Million Typical Erase Cycles per Block**
- **56-Lead, 1.2 x 14 x 20 mm Advanced Dual Die TSOP Package Technology**
- **64 Independently Lockable Blocks**
- **Revolutionary Architecture**
  - **100% Backwards-Compatible with Intel 28F016SA**
  - **Pipelined Command Execution**
  - **Program during Erase**
- **2 mA Typical I<sub>CC</sub> in Static Mode**
- **2 µA Typical Deep Power-Down**
- **State-of-the-Art 0.6 µm ETOX™ IV Flash Technology**

Intel's DD28F032SA 32-Mbit FlashFile™ memory is a revolutionary architecture which enables the design of truly mobile, high performance, personal computing and communication products. With innovative capabilities, low power operation and very high read/program performance, the DD28F032SA is also the ideal choice for designing embedded mass storage flash memory systems.

The DD28F032SA is the result of highly-advanced packaging innovation which encapsulates two 28F016SA die in a single Dual Die Thin Small Outline Package (DDTSOP).

The DD28F032SA is the highest density, highest performance nonvolatile read/program solution for solid-state storage applications. Its symmetrically-blocked architecture (100% compatible with the 28F016SA 16-Mbit FlashFile memory), very high-cycling, low-power 3.3V operation, very fast program and read performance and selective block locking provide a highly flexible memory component suitable for high-density memory cards, Resident Flash Arrays and PCMCIA-ATA Flash Drives. The DD28F032SA's dual read voltage enables the design of memory cards which can be read/written in 3.3V and 5.0V systems interchangeably. Its x8/x16 architecture allows the optimization of memory to processor interface. The flexible block locking option enables bundling of executable application software in a Resident Flash Array or memory card. The DD28F032SA will be manufactured on Intel's 0.6 µm ETOX IV technology.

## 1.0 PRODUCT OVERVIEW

The DD28F032SA is a high-performance 32-Mbit (33,554,432-bit) block erasable nonvolatile random access memory organized as either 2 Mword x 16, or 4 Mbyte x 8. The DD28F032SA is built using two 28F016SA chips encapsulated in a single 56-lead TSOP Type I package. The DD28F032SA includes sixty-four 64-KB (65,536) blocks or sixty-four 32-KW (32,768) blocks.

The DD28F032SA architecture allows operations to be performed on a single, 16-Mbit chip at a time.

The implementation of a new architecture, with many enhanced features, will improve the device operating characteristics and results in greater product reliability and ease of use.

Among the significant enhancements on the DD28F032SA:

- 3.3V Low Power Capability
- Improved Program Performance
- Dedicated Block Program/Erase Protection

A 3/5# input pin reconfigures the device internally for optimized 3.3V or 5.0V read/program operation.

The DD28F032SA will be available in a 56-lead, 1.2 mm thick, 14 mm x 20 mm Dual Die TSOP Type I package. This form factor and pinout allow for very high board layout densities. The DD28F032SA is pinout and footprint compatible with the 28F016SA.

Two Command User Interfaces (CUI) serve as the system interface between the microprocessor or microcontroller and the internal memory operation.

Internal algorithm automation allows word/byte programs and block erase operations to be executed using a two-write command sequence to the CUI in the same way as the 28F016SA 16-Mbit FlashFile memory.

A super-set of commands has been added to the basic 28F008SA (8-Mbit FlashFile memory) command-set to achieve higher program performance and provide additional capabilities.

These new commands and features include:

- Page Buffer Writes to Flash
- Command Queueing Capability
- Automatic Data Programs during Erase
- Software Locking of Memory Blocks
- Two-Byte Successive Programs in 8-bit Systems
- Erase All Unlocked Blocks

These operations can only be performed on one 16-Mbit device at a time. If the WSM is busy performing an operation, the system should not attempt to select the other device.

Writing of memory data is performed in either byte or word increments typically within 6  $\mu$ s, a 33% improvement over the 28F008SA. A block erase operation erases one of the 64 blocks in typically 0.6 sec, independent of the other blocks, which is a 65% improvement over the 28F008SA.

Each block can be written and erased a minimum of 100,000 cycles. Systems can achieve typically 1 million block erase cycles by providing wear-leveling algorithms and graceful block retirement. These techniques have already been employed in many flash file systems. Additionally, wear leveling of block erase cycles can be used to minimize the program/erase performance differences across blocks.

The DD28F032SA incorporates two Page Buffers of 256 bytes (128 words) on each 28F016SA to allow page data programs. This feature can improve a system program performance by up to 4.8 times over previous flash memory devices.

All operations are started by a sequence of command writes to the device. Three Status Registers (described in detail later) and a RY/BY# output pin provide information on the progress of the requested operation.

The DD28F032SA allows queueing of the next operation while the memory executes the current operation. This eliminates system overhead when writing several bytes in a row to the array or erasing several blocks at the same time. The DD28F032SA can also perform program operations to one block of memory while performing erase of another block. However, simultaneous program and/or erase operations are not allowed on both 28F016SA devices. See Modes of Operation, Section 3.0.

The DD28F032SA provides user-selectable block locking to protect code or data such as device drivers, PCMCIA card information, ROM-executable O/S or application code. Each block has an associated nonvolatile lock-bit which determines the lock status of the block. In addition, the DD28F032SA has a master Write Protect pin (WP#) which prevents any modifications to memory blocks whose lock-bits are set.

The DD28F032SA contains three types of Status Registers to accomplish various functions:

- A Compatible Status Register (CSR) which is 100% compatible with the 28F008SA FlashFile memory's Status Register. This register, when used alone, provides a straightforward upgrade capability to the DD28F032SA from a 28F008SA-based design.
- A Global Status Register (GSR) which informs the system of Command Queue status, Page Buffer status, and overall Write State Machine (WSM) status.
- 64 Block Status Registers (BSRs) which provide block-specific status information such as the block lock-bit status.

The GSR and BSR memory maps for byte-wide and word-wide modes are shown in Figures 4 and 5.

The DD28F032SA incorporates an open drain RY/BY# output pin. This feature allows the user to OR-tie many RY/BY# pins together in a multiple memory configuration such as a Resident Flash Array. Other configurations of the RY/BY# pin are enabled via special CUI commands and are described in detail in the *16-Mbit Flash Product Family User's Manual*.

The DD28F032SA also incorporates three chip-enable input pins, CE<sub>0</sub>#, CE<sub>1</sub># and CE<sub>2</sub>#. The active low combination of CE<sub>0</sub># and CE<sub>1</sub># controls the first 28F016SA. The active low combination of CE<sub>0</sub># and CE<sub>2</sub># controls the second 28F016SA.

The BYTE# pin allows either x8 or x16 read/programs to the DD28F032SA. BYTE# at logic low selects 8-bit mode with address A<sub>0</sub> selecting between low byte and high byte. On the other hand, BYTE# at logic high enables 16-bit operation with address A<sub>1</sub> becoming the lowest order address and address A<sub>0</sub> is not used (don't care). A device block diagram is shown in Figure 1.

The DD28F032SA is specified for a maximum access time of 70 ns (t<sub>ACC</sub>) at 5.0V operation (4.75V to 5.25V) over the commercial temperature range (0°C to +70°C). A corresponding maximum access time of 150 ns at 3.3V (3.0V to 3.6V and 0°C to +70°C) is achieved for reduced power consumption applications.

The DD28F032SA incorporates an Automatic Power Saving (APS) feature which substantially reduces the active current when the device is in static mode of operation (addresses not switching).

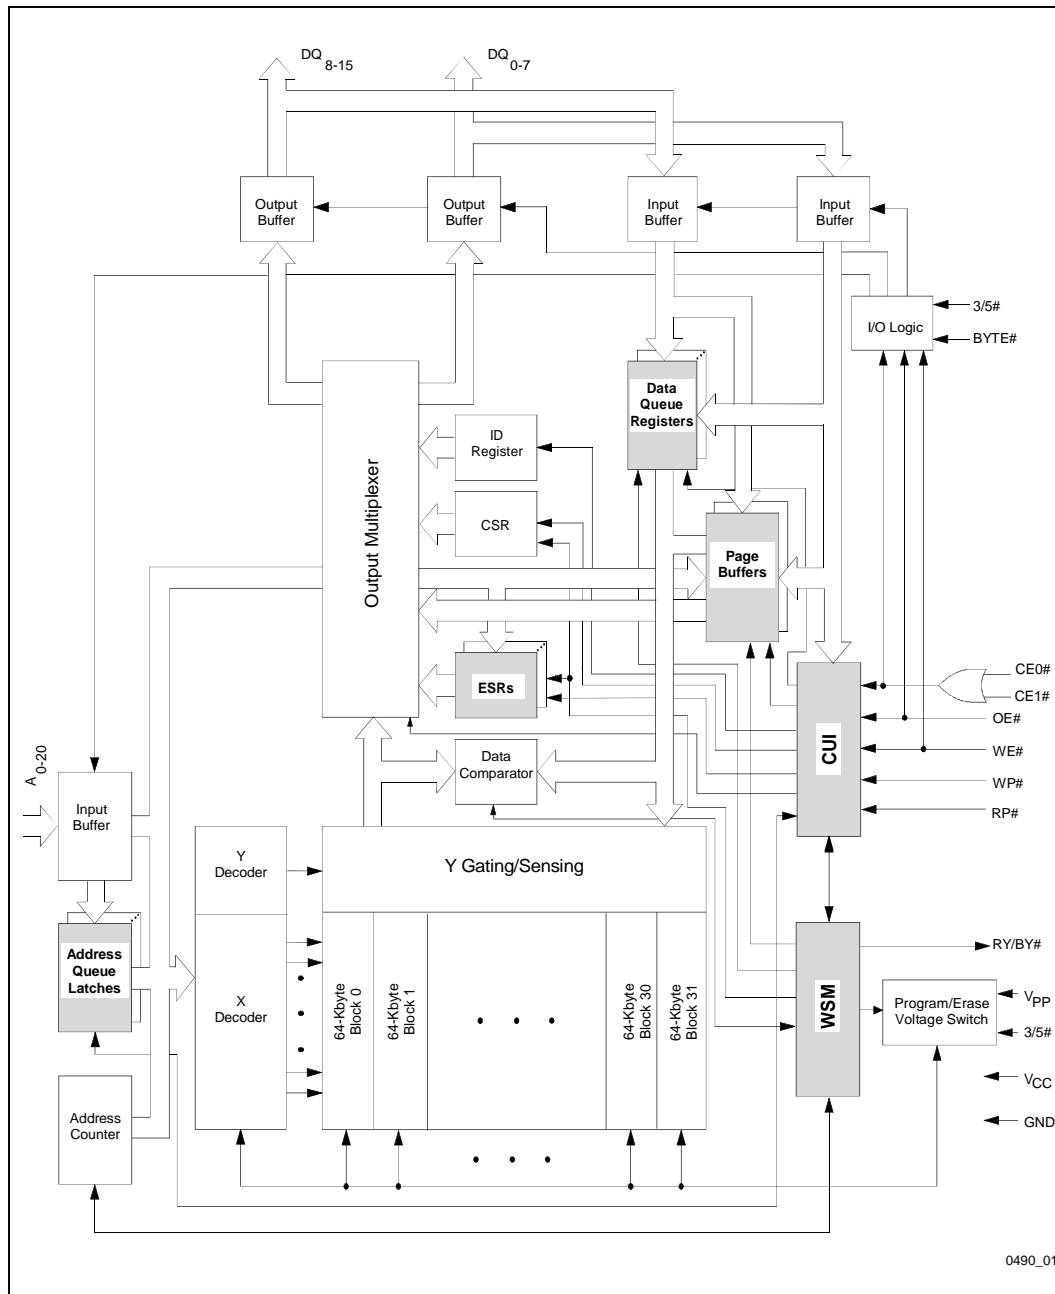

A deep power-down mode of operation is invoked when the RP# (called PWD# on the 28F008SA) pin is driven low. This mode provides additional write protection by acting as a device reset pin during power transitions. In the deep power-down state, the WSM is reset (any current operation will abort) and the CSR, GSR and BSR registers are cleared.

A CMOS standby mode of operation is enabled when either CE<sub>0</sub>#, or both CE<sub>1</sub># and CE<sub>2</sub>#, transition high and RP# stays high with all input control pins at CMOS levels.

## 2.0 DEVICE PINOUT

The DD28F032SA Standard 56-Lead Dual Die TSOP Type I pinout configuration is shown in Figure 2.

**Figure 1. Block Diagram of 16-Mbit Devices in DD28F032SA**  
**Architectural Evolution Includes Page Buffers, Queue Registers and Extended Registers**

## 2.1 Lead Descriptions

Symbol	Type	Name and Function
A <sub>0</sub>	INPUT	<b>BYTE-SELECT ADDRESS:</b> Selects between high and low byte when device is in x8 mode. This address is latched in x8 data programs. Not used in x16 mode (i.e., the A <sub>0</sub> input buffer is turned off when BYTE# is high).
A <sub>1</sub> –A <sub>15</sub>	INPUT	<b>WORD-SELECT ADDRESSES:</b> Select a word within one 64-Kbyte block. A <sub>6-15</sub> selects 1 of 1024 rows, and A <sub>1-5</sub> selects 16 of 512 columns. These addresses are latched during data programs.
A <sub>16</sub> –A <sub>20</sub>	INPUT	<b>BLOCK-SELECT ADDRESSES:</b> Select 1 of 32 erase blocks in each of the two 28F016SAs. These addresses are latched during data programs, block erase and lock block operations.
DQ <sub>0</sub> –DQ <sub>7</sub>	INPUT/OUTPUT	<b>LOW-BYTE DATA BUS:</b> Inputs data and commands during CUI write cycles. Outputs array, buffer, identifier or status data in the appropriate read mode. Floated when the chip is de-selected or the outputs are disabled.
DQ <sub>8</sub> –DQ <sub>15</sub>	INPUT/OUTPUT	<b>HIGH-BYTE DATA BUS:</b> Inputs data during x16 data program operations. Outputs array, buffer or identifier data in the appropriate read mode; not used for Status Register reads. Floated when the chip is de-selected or the outputs are disabled.
CE <sub>0</sub> # CE <sub>x</sub> # = CE <sub>1</sub> # or CE <sub>2</sub> #	INPUT	<b>CHIP ENABLE INPUTS:</b> Activate the device's control logic, input buffers, decoders and sense amplifiers. CE <sub>0</sub> #/CE <sub>1</sub> # enable/disable the first 28F016SA (16 Mbit No. 1) while CE <sub>0</sub> #/CE <sub>2</sub> # enable/disable the second 28F016SA (16 Mbit No. 2). CE <sub>0</sub> # active low enables chip operation while CE <sub>1</sub> # or CE <sub>2</sub> # select between the first and second device, respectively. CE <sub>1</sub> # and CE <sub>2</sub> # must not be active low simultaneously. Reference Table 3.0.
RP#	INPUT	<b>RESET/POWER-DOWN:</b> RP# low places the device in a deep power-down state. All circuits that burn static power, even those circuits enabled in standby mode, are turned off. When returning from deep power-down, a recovery time is required to allow these circuits to power-up. When RP# goes low, any current or pending WSM operation(s) are terminated, and the device is reset. All Status Registers return to ready (with all status flags cleared).
OE#	INPUT	<b>OUTPUT ENABLE:</b> Gates device data through the output buffers when low. The outputs float to tri-state off when OE# is high. <b>NOTE:</b> CE <sub>x</sub> # overrides OE#, and OE# overrides WE#.
WE#	INPUT	<b>WRITE ENABLE:</b> Controls access to the CUI, Page Buffers, Data Queue Registers and Address Queue Latches. WE# is active low, and latches both address and data (command or array) on its rising edge.
RY/BY#	OPEN DRAIN OUTPUT	<b>READY/BUSY:</b> Indicates status of the internal WSM. When low, it indicates that the WSM is busy performing an operation. RY/BY# high indicates that the WSM is ready for new operations (or WSM has completed all pending operations), or block erase is suspended, or the device is in deep power-down mode. This output is always active (i.e., not floated to tri-state off when OE# or CE <sub>0</sub> #/CE <sub>1</sub> #/CE <sub>2</sub> # are high), except if a RY/BY# Pin Disable command is issued.

## 2.1 Lead Descriptions (Continued)

Symbol	Type	Name and Function
WP#	INPUT	<b>WRITE PROTECT:</b> Erase blocks can be locked by writing a nonvolatile lock-bit for each block. When WP# is low, those locked blocks as reflected by the Block-Lock Status bits (BSR.6), are protected from inadvertent data programs or block erases. When WP# is high, all blocks can be written or erased regardless of the state of the lock-bits. The WP# input buffer is disabled when RP# transitions low (deep power-down mode).
BYTE#	INPUT	<b>BYTE ENABLE:</b> BYTE# low places device in x8 mode. All data is then input or output on DQ <sub>0-7</sub> , and DQ <sub>8-15</sub> float. Address A <sub>0</sub> selects between the high and low byte. BYTE# high places the device in x16 mode, and turns off the A <sub>0</sub> input buffer. Address A <sub>1</sub> then becomes the lowest order address.
3/5#	INPUT	<b>3.3/5.0 VOLT SELECT:</b> 3/5# high configures internal circuits for 3.3V operation. 3/5# low configures internal circuits for 5.0V operation. <b>NOTES:</b> Reading the array with 3/5# high in a 5.0V system could damage the device. There is a significant delay from 3/5# switching to valid data.
V <sub>PP</sub>	SUPPLY	<b>ERASE/PROGRAM POWER SUPPLY:</b> For erasing memory array blocks or writing words/bytes/pages into the flash array.
V <sub>CC</sub>	SUPPLY	<b>DEVICE POWER SUPPLY (3.3V ± 0.3V, 5.0V ± 0.5V, 5.0V ± 0.25V):</b> Do not leave any power pins floating.
GND	SUPPLY	<b>GROUND FOR ALL INTERNAL CIRCUITRY:</b> Do not leave any ground pins floating.
NC		<b>NO CONNECT:</b> Lead may be driven or left floating.

#### NOTES:

1. X can be V<sub>IH</sub> or V<sub>IL</sub> for address or control pins except for RY/BY#, which is either V<sub>OL</sub> or V<sub>OH</sub>.
2. RY/BY# output is open drain. When the WSM is ready, block erase is suspended or the device is in deep power-down mode, RY/BY# will be at V<sub>OH</sub> if it is tied to V<sub>CC</sub> through a resistor. RY/BY# at V<sub>OH</sub> is independent of OE# while a WSM operation is in progress.
3. RP# at GND ± 0.2V ensures the lowest deep power-down current.
4. A<sub>0</sub> and A<sub>1</sub> at V<sub>IL</sub> provide device manufacturer codes in x8 and x16 modes respectively. A<sub>0</sub> and A<sub>1</sub> at V<sub>IH</sub> provide device ID codes in x8 and x16 modes respectively. All other addresses are set to zero.
5. Commands for different block erase operations, data program operations or lock-block operations can only be successfully completed when V<sub>PP</sub> = V<sub>PPH</sub>.
6. While the WSM is running, RY/BY# in level-mode (default) stays at V<sub>OL</sub> until all operations are complete. RY/BY# goes to V<sub>OH</sub> when the WSM is not busy or in erase suspend mode.
7. RY/BY# may be at V<sub>OL</sub> while the WSM is busy performing various operations; for example, a Status Register read during a data program operation.
8. CE<sub>X</sub># = CE<sub>1</sub># or CE<sub>2</sub>#.

### 5.3 28F008SA Compatible Mode Command Bus Definitions

Command	Notes	First Bus Cycle			Second Bus Cycle		
		Oper	Addr	Data	Oper	Addr	Data
Read Array		Write	X	xxFFH	Read	AA	AD
Intelligent Identifier	1	Write	X	xx90H	Read	IA	ID
Read Compatible Status Register	2	Write	X	xx70H	Read	X	CSRD
Clear Status Register	3	Write	X	xx50H			
Word/Byte Program		Write	X	xx40H	Write	PA	PD
Alternate Word/Byte Program		Write	X	xx10H	Write	PA	PD
Block Erase/Confirm		Write	X	xx20H	Write	BA	xxD0H
Erase Suspend/Resume		Write	X	xxB0H	Write	X	xxD0H

#### ADDRESS

A = Array Address  
 BA = Block Address  
 IA = Identifier Address  
 PA = Program Address  
 X = Don't Care

#### DATA

AD = Array Data  
 CSRD = CSR Data  
 ID = Identifier Data  
 PD = Program Data

#### NOTES:

- Following the Intelligent Identifier command, two read operations access the manufacturer and device signature codes.
- The CSR is automatically available after device enters data program, block erase, or suspend operations.
- Clears CSR.3, CSR.4 and CSR.4. Also clears GSR.4 and all BSR.4 and BSR.2 bits.
- The upper byte of the data bus (DQ<sub>8-15</sub>) during command writes is a "Don't Care" in x16 operation of the device.

See Status Register definitions.

## 5.4 28F016SA-Performance Enhancement Command Bus Definitions

Abort			Write	X	xx80H						

### ADDRESS

BA = Block Address  
PBA = Page Buffer Address  
RA = Extended Register Address  
PA = Program Address  
X = Don't Care

### DATA

AD = Array Data  
PD = Page Buffer Data  
BSRD = BSR Data  
GSRD = GSR Data

WC (L,H) = Word Count (Low, High)  
BC (L,H) = Byte Count (Low, High)  
WD (L,H) = Write Data (Low, High)

**NOTES:**

1. RA can be the GSR address or any BSR address. See Figures 4 and 5 for Extended Status Register Memory Maps.
2. Upon device power-up, all BSR lock-bits come up locked. The Upload Status Bits command must be written to reflect the actual lock-bit status.
3.  $A_0$  is automatically complemented to load the second byte of data. BYTE# must be at  $V_{IL}$ .  
The  $A_0$  value determines which WD/BC is supplied first:  $A_0 = 0$  looks at the WDL/BCL,  $A_0 = 1$  looks at the WDH/BCH.
4. BCH/WCH must be at 00H for this product because of the 256-byte (128-word) Page Buffer size and to avoid writing the Page Buffer contents to more than one 256-byte segment within an array block. They are simply shown for future Page Buffer expandability.
5. In x16 mode, only the lower byte  $DQ_{0-7}$  is used for WCL and WCH. The upper byte  $DQ_{8-15}$  is a don't care.
6. PBA and PD (whose count is given in cycles 2 and 3) are supplied starting in the fourth cycle, which is not shown.
7. This command allows the user to swap between available Page Buffers (0 or 1).
8. These commands reconfigure the RY/BY# output to one of two pulse-modes or enable and disable the RY/BY# function.
9. Program address, PA, is the destination address in the flash array which must match the source address in the Page Buffer. Refer to the *16-Mbit Flash Product Family User's Manual*.
10. BCL = 00H corresponds to a byte count of 1. Similarly, WCL = 00H corresponds to a word count of 1.
11. To ensure that the DD28F032SA's power consumption during sleep mode reads the deep power-down current level, the system also needs to de-select the chip by taking either or both  $CE_0\#$  or  $CE_1\#/CE_2\#$  high.
12. The upper byte of the data bus ( $DQ_{8-15}$ ) during command programs is a "Don't Care" in x16 operation of the device.

**5.5 Compatible Status Register**

WSMS	ESS	ES	DWS	VPPS	R	R	R
7	6	5	4	3	2	1	0

NOTES:	
<b>CSR.7 = WRITE STATE MACHINE STATUS</b> 1 = Ready 0 = Busy	RY/BY# output or WSMS bit must be checked to determine completion of an operation (erase suspend, block erase or data program) before the appropriate Status bit (ESS, ES or DWS) is checked for success.
<b>CSR.6 = ERASE-SUSPEND STATUS</b> 1 = Erase Suspended 0 = Erase In Progress/Completed	
<b>CSR.5 = ERASE STATUS</b> 1 = Error in Block Erasure 0 = Successful Block Erase	If DWS and ES are set to "1" during a block erase attempt, an improper command sequence was entered. Clear the CSR and attempt the operation again.
<b>CSR.4 = DATA WRITE STATUS</b> 1 = Error in Data Program 0 = Data Program Successful	
<b>CSR.3 = <math>V_{PP}</math> STATUS</b> 1 = $V_{PP}$ Low Detect, Operation Abort 0 = $V_{PP}$ OK	The VPPS bit, unlike an A/D converter, does not provide continuous indication of $V_{PP}$ level. The WSM interrogates $V_{PP}$ 's level only after the Data Program or Block Erase command sequences have been entered, and informs the system if $V_{PP}$ has not been switched on. VPPS is not guaranteed to report accurate feedback between $V_{PPL}$ and $V_{PPH}$ .
<b>CSR.2-0 = RESERVED FOR FUTURE ENHANCEMENTS</b> These bits are reserved for future use; mask them out when polling the CSR.	

## 5.6 Global Status Register

WSMS	OSS	DOS	DSS	QS	PBAS	PBS	PBSS
7	6	5	4	3	2	1	0

<p><b>GSR.7 = WRITE STATE MACHINE STATUS</b>  1 = Ready  0 = Busy</p> <p><b>GSR.6 = OPERATION SUSPEND STATUS</b>  1 = Operation Suspended  0 = Operation in Progress/Completed</p> <p><b>GSR.5 = DEVICE OPERATION STATUS</b>  1 = Operation Unsuccessful  0 = Operation Successful or Currently Running</p> <p><b>GSR.4 = DEVICE SLEEP STATUS</b>  1 = Device in Sleep  0 = Device Not in Sleep</p> <p><b>MATRIX = 5/4</b>  0 0 = Operation Successful or Currently Running  0 1 = Device in Sleep Mode or Pending Sleep  1 0 = Operation Unsuccessful  1 1 = Operation Unsuccessful or Aborted</p> <p><b>GSR.3 = QUEUE STATUS</b>  1 = Queue Full  0 = Queue Available</p> <p><b>GSR.2 = PAGE BUFFER AVAILABLE STATUS</b>  1 = One or Two Page Buffers Available  0 = No Page Buffer Available</p> <p><b>GSR.1 = PAGE BUFFER STATUS</b>  1 = Selected Page Buffer Ready  0 = Selected Page Buffer Busy</p> <p><b>GSR.0 = PAGE BUFFER SELECT STATUS</b>  1 = Page Buffer 1 Selected  0 = Page Buffer 0 Selected</p>				<p><b>NOTES:</b></p> <p>[1] RY/BY# output or WSMS bit must be checked to determine completion of an operation (block lock, erase suspend, any RY/BY# reconfiguration, Upload Status Bits, block erase or data program) before the appropriate Status bit (OSS or DOS) is checked for success.</p> <p>If operation currently running, then GSR.7 = 0.  If device pending sleep, then GSR.7 = 0.</p> <p>Operation aborted: unsuccessful due to Abort command.</p> <p>Each 28F016SA device contains two Page Buffers.</p> <p>Selected Page Buffer is currently busy with WSM operation</p>			
---	--	--	--	---	--	--	--

### NOTE:

- When multiple operations are queued, checking BSR.7 only provides indication of completion for that particular block. GSR.7, or CSR.7, provides indication when all queued operations are completed.

## 5.7 Block Status Register

BS	BLS	BOS	BOAS	QS	VPPS	R	R
7	6	5	4	3	2	1	0

**BSR.7 = BLOCK STATUS**  
1 = Ready  
0 = Busy

**BSR.6 = BLOCK LOCK STATUS**  
1 = Block Unlocked for Program/Erase  
0 = Block Locked for Program/Erase

**BSR.5 = BLOCK OPERATION STATUS**  
1 = Operation Unsuccessful  
0 = Operation Successful or Currently Running

**BSR.4 = BLOCK OPERATION ABORT STATUS**  
1 = Operation Aborted  
0 = Operation Not Aborted

**MATRIX 5/4**  
0 0 = Operation Successful or Currently Running  
0 1 = Not a Valid Combination  
1 0 = Operation Unsuccessful  
1 1 = Operation Aborted

**BSR.3 = QUEUE STATUS**  
1 = Queue Full  
0 = Queue Available

**BSR.2 = V<sub>PP</sub> STATUS**  
1 = V<sub>PP</sub> Low Detect, Operation Abort  
0 = V<sub>PP</sub> OK

**BSR.1-0 = RESERVED FOR FUTURE ENHANCEMENTS**  
These bits are reserved for future use; mask them out when polling the BSRs.

**NOTES:**  
<sup>[1]</sup> RY/BY# output or BS bit must be checked to determine completion of an operation (block lock, erase suspend, any RY/BY# reconfiguration, Upload Status Bits, block erase or data program) before the appropriate Status bits (BOS, BLS) is checked for success.

The BOAS bit will not be set until BSR.7 = 1.

Operation halted via Abort command.

### NOTE:

- When multiple operations are queued, checking BSR.7 only provides indication of completion for that particular block. GSR.7, or CSR.7, provides indication when all queued operations are completed.

## 6.0 ELECTRICAL SPECIFICATIONS

### 6.1 Absolute Maximum Ratings\*

Temperature Under Bias .....0°C to +80°C

Storage Temperature .....–65°C to +125°C

NOTICE: This is a production datasheet. The specifications are subject to change without notice. Verify with your local Intel Sales office that you have the latest datasheet before finalizing a design.

\* **WARNING:** Stressing the device beyond the "Absolute Maximum Ratings" may cause permanent damage. These are stress ratings only. Operation beyond the "Operating Conditions" is not recommended and extended exposure beyond the "Operating Conditions" may affect device reliability.

#### $V_{CC} = 3.3V \pm 0.3V$ Systems

Symbol	Parameter	Notes	Min	Max	Units	Test Conditions
$T_A$	Operating Temperature, Commercial	1	0	70	°C	Ambient Temperature
$V_{CC}$	$V_{CC}$ with Respect to GND	2	–0.2	7.0	V	
$V_{PP}$	$V_{PP}$ Supply Voltage with Respect to GND	2,3	–0.2	14.0	V	
V	Voltage on any Pin (except $V_{CC}, V_{PP}$ ) with Respect to GND	2	–0.5	$V_{CC} + 0.5$	V	
I	Current into Any Non-Supply Pin	5		± 30	mA	
$I_{OUT}$	Output Short Circuit Current	4		100	mA	

#### $V_{CC} = 5.0V \pm 0.5V, V_{CC} = 5.0V \pm 0.25V$ Systems<sup>(6)</sup>

Symbol	Parameter	Notes	Min	Max	Units	Test Conditions
$T_A$	Operating Temperature, Commercial	1	0	70	°C	Ambient Temperature
$V_{CC}$	$V_{CC}$ with Respect to GND	2	–0.2	7.0	V	
$V_{PP}$	$V_{PP}$ Supply Voltage with Respect to GND	2,3	–0.2	14.0	V	
V	Voltage on Any Pin (except $V_{CC}, V_{PP}$ ) with Respect to GND	2	–2.0	7.0	V	
I	Current into Any Non-Supply Pin	5		± 30	mA	
$I_{OUT}$	Output Short Circuit Current	4		100	mA	

#### NOTES:

- Operating temperature is for commercial product defined by this specification.
- Minimum DC voltage is –0.5V on input/output pins. During transitions, this level may undershoot to –2.0V for periods <20 ns. Maximum DC voltage on input/output pins is  $V_{CC} + 0.5V$  which, during transitions, may overshoot to  $V_{CC} + 2.0V$  for periods <20 ns.
- Maximum DC voltage on  $V_{PP}$  may overshoot to +14.0V for periods <20 ns.
- Output shorted for no more than one second. No more than one output shorted at a time.
- This specification also applies to pins marked "NC."
- 5%  $V_{CC}$  specifications refer to the DD28F032SA-070 in its High Speed Test configuration.

## 6.2 Capacitance

For a 3.3V System:

Symbol	Parameter	Notes	Typ	Max	Units	Test Conditions
C <sub>IN</sub>	Capacitance Looking into an Address/Control Pin	1	12	16	pF	T <sub>A</sub> = +25°C, f = 1.0 MHz
C <sub>OUT</sub>	Capacitance Looking into an Output Pin	1	16	24	pF	T <sub>A</sub> = +25°C, f = 1.0 MHz
C <sub>LOAD</sub>	Load Capacitance Driven by Outputs for Timing Specifications	1		50	pF	For V <sub>CC</sub> = 3.3V ± 0.3V
	Equivalent Load Timing Circuit			2.5	ns	50Ω Transmission Line Delay

For a 5.0V System:

Symbol	Parameter	Notes	Typ	Max	Units	Test Conditions
C <sub>IN</sub>	Capacitance Looking into an Address/Control Pin	1	12	16	pF	T <sub>A</sub> = +25°C, f = 1.0 MHz
C <sub>OUT</sub>	Capacitance Looking into an Output Pin	1	16	24	pF	T <sub>A</sub> = +25°C, f = 1.0 MHz
C <sub>LOAD</sub>	Load Capacitance Driven by Outputs for Timing Specifications	1		100	pF	For V <sub>CC</sub> = 5.0V ± 0.5V
				30	pF	For V <sub>CC</sub> = 5.0V ± 0.25V
	Equivalent Testing Load Circuit for V <sub>CC</sub> ± 10%			2.5	ns	25Ω Transmission Line Delay
	Equivalent Testing Load Circuit for V <sub>CC</sub> ± 5%			2.5	ns	83Ω Transmission Line Delay

**NOTE:**

1. Sampled, not 100% tested.

## 6.3 Timing Nomenclature

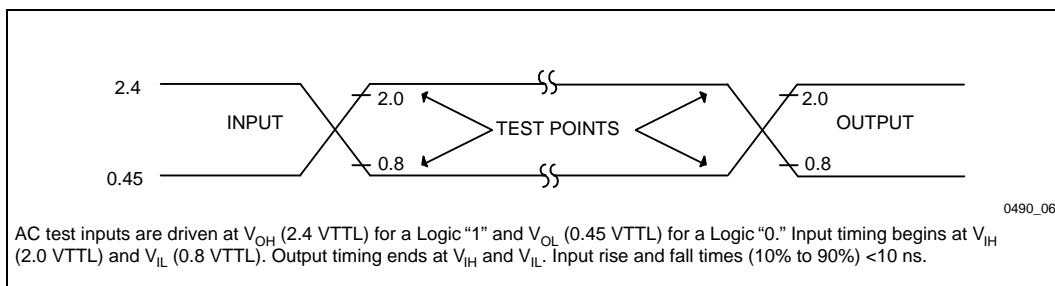

All 3.3V system timings are measured from where signals cross 1.5V.

For 5.0V systems use the standard JEDEC cross point definitions.

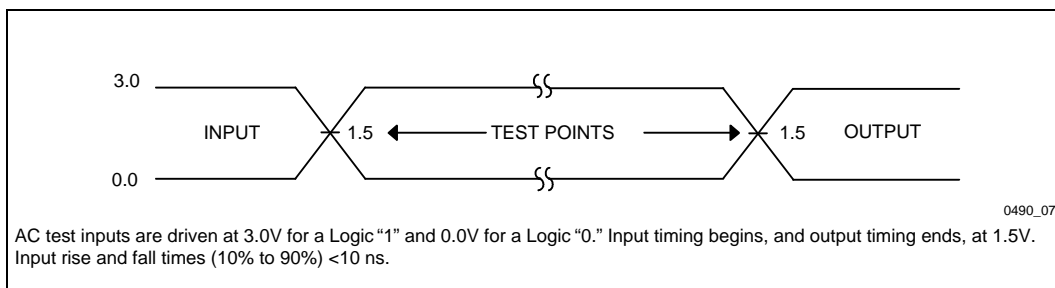

Each timing parameter consists of 5 characters. Some common examples are defined below:

t <sub>CE</sub>	t <sub>ELQV</sub> time(t) from CE <sub>x</sub> # (E) going low (L) to the outputs (Q) becoming valid (V)
t <sub>OE</sub>	t <sub>GLQV</sub> time(t) from OE # (G) going low (L) to the outputs (Q) becoming valid (V)
t <sub>ACC</sub>	t <sub>AVQV</sub> time(t) from address (A) valid (V) to the outputs (Q) becoming valid (V)
t <sub>AS</sub>	t <sub>AVWH</sub> time(t) from address (A) valid (V) to WE# (W) going high (H)
t <sub>DH</sub>	t <sub>WHDX</sub> time(t) from WE# (W) going high (H) to when the data (D) can become undefined (X)

	Pin Characters		Pin States
A	Address Inputs	H	High
D	Data Inputs	L	Low
Q	Data Outputs	V	Valid
E	CE <sub>x</sub> # (Chip Enable)	X	Driven, but not necessarily valid
F	BYTE# (Byte Enable)	Z	High Impedance
G	OE# (Output Enable)		
W	WE# (Write Enable)		
P	RP# (Deep Power-Down Pin)		
R	RY/BY# (Ready Busy)		
V	Any Voltage Level		
Y	3/5# Pin		
5V	V <sub>CC</sub> at 4.5V Minimum		
3V	V <sub>CC</sub> at 3.0V Minimum		

**Figure 6. Transient Input/Output Reference Waveform ( $V_{CC} = 5.0V$ ) for Standard Test Configuration<sup>(1)</sup>**

**Figure 7. Transient Input/Output Reference Waveform ( $V_{CC} = 3.3V$ ) and High Speed Reference Waveform <sup>(2)</sup> ( $V_{CC} = 5.0V \pm 5\%$ )**

**NOTES:**

$I_{PPS}$	$V_{PP}$ Standby/	1		$\pm 2$	$\pm 20$	$\mu A$	$V_{PP} \leq V_{CC}$
$I_{PPR}$	Read Current			130	400	$\mu A$	$V_{PP} > V_{CC}$
$I_{PPD}$	$V_{PP}$ Deep Power-Down Current	1		0.4	10	$\mu A$	$RP\# = GND \pm 0.2V$

## 6.4 DC Characteristics (Continued)

 $V_{CC} = 3.3V \pm 0.3V$ ,  $T_A = 0^{\circ}C$  to  $+70^{\circ}C$ 

3/5# Pin Set High for 3.3V Operations

Symbol	Parameter	Notes	Min	Typ	Max	Units	Test Conditions
$I_{PPW}$	$V_{PP}$ Program Current for Word or Byte	1		10	15	mA	$V_{PP} = V_{PPH}$ Program in Progress
$I_{PPE}$	$V_{PP}$ Block Erase Current	1		4	10	mA	$V_{PP} = V_{PPH}$ Block Erase in Progress
$I_{PPES}$	$V_{PP}$ Erase Suspend Current	1		130	400	$\mu A$	$V_{PP} = V_{PPH}$ Block Erase Suspended
$V_{IL}$	Input Low Voltage		-0.3		0.8	V	
$V_{IH}$	Input High Voltage		2.0		$V_{CC} \pm 0.3$	V	
$V_{OL}$	Output Low Voltage				0.4	V	$V_{CC} = V_{CC} \text{ Min}$ $I_{OL} = 4 \text{ mA}$
$V_{OH1}$	Output High Voltage		2.4			V	$V_{CC} = V_{CC} \text{ Min}$ $I_{OH} = -2.0 \text{ mA}$
$V_{OH2}$			$V_{CC} - 0.2$				$V_{CC} = V_{CC} \text{ Min}$ $I_{OH} = -100 \mu A$
$V_{PPL}$	$V_{PP}$ during Normal Operations	3	0.0		6.5	V	
$V_{PPH}$	$V_{PP}$ during Program/Erase Operations		11.4	12.0	12.6	V	
$V_{LKO}$	$V_{CC}$ Program/Erase Lock Voltage		2.0			V	

### NOTES:

1. All current are in RMS unless otherwise noted. Typical values at  $V_{CC} = 3.3V$ ,  $V_{PP} = 12.0V$ ,  $T = 25^{\circ}C$ . These currents are valid for all product versions (package and speeds).
2.  $I_{CCES}$  is specified with the device de-selected. If the device is read while in erase suspend mode, current draw is the sum of  $I_{CCES}$  and  $I_{CCR}$ .
3. Block erases, word/byte programs and lock block operations are inhibited when  $V_{PP} = V_{PPL}$  and not guaranteed in the range between  $V_{PPH}$  and  $V_{PPL}$ .
4. Automatic Power Savings (APS) reduces  $I_{CCR}$  to  $<1 \text{ mA}$  in static operation.
5. CMOS Inputs are either  $V_{CC} \pm 0.2V$  or  $GND \pm 0.2V$ . TTL Inputs are either  $V_{IL}$  or  $V_{IH}$ .
6.  $CE_X\# = CE_1\#$  or  $CE_2\#$ .
7. If operating with TTL levels, add 4 mA of  $V_{CC}$  Standby Current to max  $I_{CCR1}$ ,  $I_{CCR2}$ ,  $I_{CCW}$ ,  $I_{CCE}$  and  $I_{CCES}$ .
8. Standby current levels are not reached when putting the chip in standby mode immediately after reading the page buffer. Default the device into read array or read Status Register mode before entering standby to ensure standby current levels.

## 6.5 DC Characteristics

$V_{CC} = 5.0V \pm 0.5V$ ,  $5.0V \pm 0.25V$ ,  $T_A = 0^{\circ}C$  to  $+70^{\circ}C$

3/5# Pin Set Low for 5.0V Operations

Symbol	Parameter	Notes	Min	Typ	Max	Units	Test Conditions
$I_{IL}$	Input Load Current	1			$\pm 2$	$\mu A$	$V_{CC} = V_{CC} \text{ Max}$ $V_{IN} = V_{CC} \text{ or GND}$
$I_{LO}$	Output Leakage Current	1			$\pm 20$	$\mu A$	$V_{CC} = V_{CC} \text{ Max}$ $V_{IN} = V_{CC} \text{ or GND}$
$I_{CCS}$	$V_{CC}$ Standby Current	1,5,6,8		100	200	$\mu A$	$V_{CC} = V_{CC} \text{ Max}$ $CE_0\#, CE_X\#, RP\# = V_{CC} \pm 0.2V$ $BYTE\#, WP\#, 3/5\# = V_{CC} \pm 0.2V \text{ or GND} \pm 0.2V$

$V_{OL}$	Output Low Voltage				0.45	V	$V_{CC} = V_{CC} \text{ Min}$ , $I_{OL} = 5.8 \text{ mA}$
$V_{OH1}$	Output High Voltage		$0.85 V_{CC}$			V	$V_{CC} = V_{CC} \text{ Min}$ , $I_{OH} = -2.5 \text{ mA}$
$V_{OH2}$			$V_{CC} - 0.4$				$V_{CC} = V_{CC} \text{ Min}$ , $I_{OH} = -100 \mu A$
$V_{PPL}$	$V_{PP}$ during Normal Operations	3	0.0		6.5	V	
$V_{PPH}$	$V_{PP}$ during Prog. Erase Operations		11.4	12.0	12.6	V	
$V_{LKO}$	$V_{CC}$ Program/Erase Lock Voltage		2.0			V	

### NOTES:

- All currents are in RMS unless otherwise noted. Typical values at  $V_{CC} = 5.0V$ ,  $V_{PP} = 12.0V$ ,  $T = +25^{\circ}C$ . These currents are valid for all product versions (package and speeds).
- $I_{CCES}$  is specified with the device de-selected. If the device is read while in erase suspend mode, current draw is the sum of  $I_{CCES}$  and  $I_{CCR}$ .
- Block erases, word/byte programs and lock block operations are inhibited when  $V_{PP} = V_{PPL}$  and not guaranteed in the range between  $V_{PPH}$  and  $V_{PPL}$ .
- Automatic Power Saving (APS) reduces  $I_{CCR}$  to  $<2 \text{ mA}$  in static operation.
- CMOS Inputs are either  $V_{CC} \pm 0.2V$  or  $GND \pm 0.2V$ . TTL Inputs are either  $V_{IL}$  or  $V_{IH}$ .
- $CE_X\# = CE_1\#$  or  $CE_2\#$ .
- If operating with TTL levels, add 4 mA of  $V_{CC}$  standby current. to max  $I_{CCR1}$ ,  $I_{CCR2}$ ,  $I_{CCW}$ ,  $I_{CCE}$  and  $I_{CCES}$ .
- Standby current levels are not reached when putting the chip in standby mode immediately after reading the page buffer. Default the device into read array or read Status Register mode before entering standby to ensure standby current levels.

## 6.6 AC Characteristics—Read Only Operations<sup>(1)</sup>

$V_{CC} = 3.3V \pm 0.3V$ ,  $T_A = 0^\circ C$  to  $+70^\circ C$

Versions <sup>(5)</sup>			DD28F032SA-150		Units
Symbol	Parameter	Notes	Min	Max	
$t_{AVAV}$	Read Cycle Time		150		ns
$t_{AVQV}$	Address to Output Delay			150	ns
$t_{ELQV}$	$CE_X\#$ to Output Delay	2		150	ns
$t_{PHQV}$	RP# High to Output Delay			750	ns
$t_{GLQV}$	OE# to Output Delay	2		50	ns
$t_{ELQX}$	$CE_X\#$ to Output in Low Z	3	0		ns

### For Extended Status Register Reads

$t_{AVEL}$	Address Setup to $CE_X\#$ Going Low	3,4	0		0		0		ns
$t_{AVGL}$	Address Setup to OE# Going Low	3,4	0		0		0		ns

**NOTES:**

1. See AC Input/Output Reference Waveforms for timing measurements, Figures 6 and 7.
2. OE# may be delayed up to  $t_{ELQV} - t_{GLQV}$  after the falling edge of CE<sub>X</sub># without impact in  $t_{ELQV}$ .
3. Sampled, not 100% tested.
4. This timing parameter is used to latch the correct BSR data onto the outputs.
5. Device speeds are defined as:  
 70/80 ns at  $V_{CC} = 5.0V$  equivalent to  
 150 ns at  $V_{CC} = 3.3V$   
 100 ns at  $V_{CC} = 5.0V$  equivalent to  
 150 ns at  $V_{CC} = V_{CC} = 3.3V$
6. See AC Input/Output Reference Waveforms and AC Testing Load Circuits for High Speed Test Configuration.
7. See Standard AC Input/Output Reference Waveforms and AC Testing Load Circuit.

**Figure 11. Read Timing Waveforms**

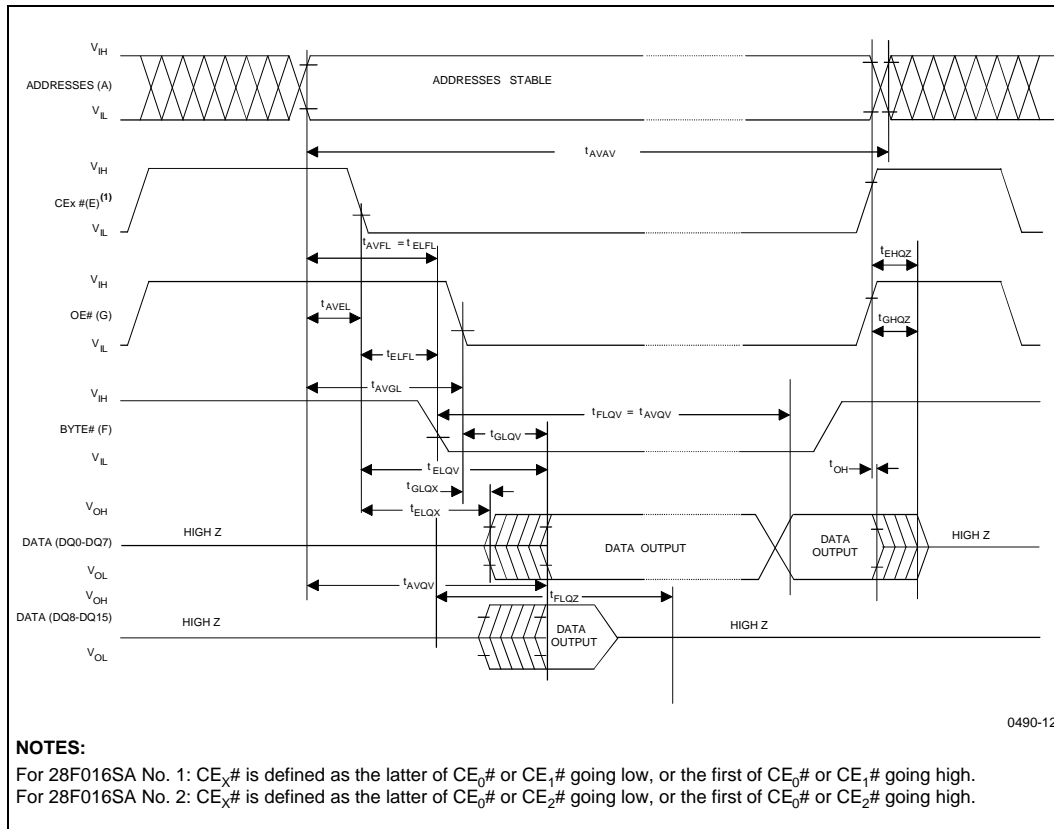

Figure 12. BYTE# Timing Waveforms

## 6.7 Power-Up and Reset Timings

Figure 13.  $V_{CC}$  Power-Up and RP# Reset Waveforms

Symbol	Parameter	Notes	Min	Max	Units
$t_{PLYL}$ $t_{PLYH}$	RP# Low to 3/5# Low (High)		0		$\mu s$
$t_{YLPH}$ $t_{YHPH}$	3/5# Low (High) to RP# High	1	2		$\mu s$
$t_{PL5V}$ $t_{PL3V}$	RP# Low to $V_{CC}$ at 4.5V Minimum (to $V_{CC}$ at 3.0V min or 3.6V max)	2	0		$\mu s$
$t_{PHEL3}$	RP# High to CE# Low (3.3V $V_{CC}$ )	1	500		
$t_{PHEL5}$	RP# High to CE# Low (5V $V_{CC}$ )	1	330		
$t_{AVQV}$	Address Valid to Data Valid for $V_{CC} = 5.0V \pm 10\%$	3		80	ns
$t_{PHQV}$	RP# High to Data Valid for $V_{CC} = 5.0V \pm 10\%$	3		480	ns

### NOTES:

CE<sub>0</sub>#, CE<sub>X</sub># and OE# are switched low after Power-Up.

1. The  $t_{YLPH}/t_{YHPH}$  and  $t_{PHEL3}/t_{PHEL5}$  times must be strictly followed to guarantee all other read and program specifications.
2. The power supply may start to switch concurrently with RP# going low.
3. The address access time and RP# high to data valid time are shown for the DD28F032SA-80 and 5.0V  $V_{CC}$  operation. Refer to the AC Characteristics-Read Only Operations for 3.3V  $V_{CC}$  operation and all other speed options.

## 6.8 AC Characteristics for WE#—Controlled Command Write Operations<sup>(1)</sup>

### NOTES:

For 28F016SA No. 1: CE<sub>x</sub># is defined as the latter of CE<sub>0</sub># or CE<sub>1</sub># going low or the first of CE<sub>0</sub># or CE<sub>1</sub># going high.

For 28F016SA No. 2: CE<sub>x</sub># is defined as the latter of CE<sub>0</sub># or CE<sub>2</sub># going low or the first of CE<sub>0</sub># or CE<sub>2</sub># going high.

- Read timings during data program and block erase are the same as for normal read.
- Refer to command definition tables for valid address and data values.
- Sampled, but not 100% tested
- Data program/block erase durations are measured to valid Status Register data.
- Word/byte program operations are typically performed with 1 programming pulse.
- Address and data are latched on the rising edge of WE# for all command write operations.
- This information will be available in a technical paper. Please call Intel's Applications Hotline or your local sales office for more information.

## 6.10 AC Characteristics for Page Buffer Write Operations<sup>(1)</sup> (Continued)

$V_{CC} = 5.0V \pm 0.5V$ ,  $5.0V \pm 0.25V$ ,  $T_A = 0^\circ C$  to  $+70^\circ C$

Versions			DD28F032SA-070			DD28F032SA-080			DD28F032SA-100			Unit
Symbol	Parameter	Notes	Min	Typ	Max	Min	Typ	Max	Min	Typ	Max	
$t_{AVAV}$	Write Cycle Time		70			80			100			ns
$t_{ELWL}$	$CE_X\#$ Setup to WE# Going Low		0			0			0			ns
$t_{AVWL}$	Address Setup to WE# Going Low	3	0			0			0			ns
$t_{DVWH}$	Data Setup to WE# Going High	2	50			50			50			ns
$t_{WLWH}$	WE# Pulse Width		40			50			50			ns
$t_{WHDX}$	Data Hold from WE# High	2	0			0			0			ns
$t_{WHAX}$	Address Hold from WE# High	2	10			10			10			ns
$t_{WHEH}$	$CE_X\#$ Hold from WE# High		10			10			10			ns
$t_{WHWL}$	WE# Pulse Width High		30			30			50			ns
$t_{GHWL}$	Read Recovery before Write		0			0			0			ns
$t_{WHGL}$	Write Recovery before Read		60			65			80			ns

### NOTES:

For 28F016SA No. 1:  $CE_X\#$  is defined as the latter of  $CE_0\#$  or  $CE_1\#$  going low or the first of  $CE_0\#$  or  $CE_1\#$  going high.

For 28F016SA No. 2:  $CE_X\#$  is defined as the latter of  $CE_0\#$  or  $CE_2\#$  going low or the first of  $CE_0\#$  or  $CE_2\#$  going high.

1. These are WE#-controlled write timings, equivalent  $CE_X\#$ -controlled write timings apply.
2. Sampled, not 100% tested.
3. Address must be valid during the entire WE# low pulse or the entire  $CE_X\#$  low pulse (for  $CE_X\#$ -controlled write timings).

(Loading Data to the Page Buffer)

## 6.11 Erase and Word/Byte Write Performance, Cycling Performance and Suspend Latency<sup>(3)</sup>

$V_{CC} = 3.3V \pm 0.3V$ ,  $V_{PP} = 12.0V \pm 0.6V$ ,  $T_A = 0^{\circ}C$  to  $+70^{\circ}C$

Sym	Parameter	Notes	Min	Typ <sup>(1)</sup>	Max	Units	Test Conditions
	Page Buffer Byte Write Time	2,4		3.26	Note 6	$\mu s$	
	Page Buffer Word Write Time	2,4		6.53	Note 6	$\mu s$	
$t_{WHRH}^1$	Word/Byte Program Time	2		9	Note 6	$\mu s$	
$t_{WHRH}^2$	Block Program Time	2		0.6	2.1	sec	Byte Program
$t_{WHRH}^3$	Block Program Time	2		0.3	1.0	sec	Word Program
	Block Erase Time	2		0.8	10	sec	
	Full Chip Erase Time	2		51.2		sec	
	Erase Suspend Latency Time to Read			7.0		$\mu s$	
	Auto Erase Suspend Latency Time to Program			10.0		$\mu s$	
	Erase Cycles	5	100,000	1,000,000		Cycles	

$V_{CC} = 5.0V \pm 0.5V$ ,  $V_{PP} = 12.0V \pm 0.6V$ ,  $T_A = 0^{\circ}C$  to  $+70^{\circ}C$

Sym	Parameter	Notes	Min	Typ <sup>(1)</sup>	Max	Units	Test Conditions
	Page Buffer Byte Write Time	2,4		2.76	Note 6	$\mu s$	
	Page Buffer Word Write Time	2,4		5.51	Note 6	$\mu s$	
$t_{WHRH}^1$	Word/Byte Program Time	2		6	Note 6	$\mu s$	
$t_{WHRH}^2$	Block Program Time	2		0.4	2.1	sec	Byte Program
$t_{WHRH}^3$	Block Program Time	2		0.2	1.0	sec	Word Program
	Block Erase Time	2		0.6	10	sec	
	Full Chip Erase Time	2		38.4		sec	
	Erase Suspend Latency Time to Read			5.0		$\mu s$	
	Auto Erase Suspend Latency Time to Program			8.0		$\mu s$	
	Erase Cycles	5	100,000	1,000,000		Cycles	

### NOTES:

1.  $+25^{\circ}C$ ,  $V_{CC} = 3.3V$  or  $5.0V$  nominal,  $V_{PP} = 12.0V$  nominal, 10K cycles.
2. Excludes system-level overhead.
3. These performance numbers are valid for all speed versions.
4. This assumes using the full Page Buffer to program to the flash memory (256 bytes or 128 words).
5. 1,000,000 cycle performance assumes the application uses block retirement techniques.
6. This information will be available in a technical paper. Please call Intel's Application hotline or your local Intel sales office for more information.
