## User Application Note

### 1. ROM, OTP, ICE

| ROM     | OTP      | ICE    |
|---------|----------|--------|
| EM78800 | EM78P811 | ICE811 |

### 2. Main Function Difference

|                   | EM78800     | EM78P811    |
|-------------------|-------------|-------------|
| Operation voltage | 2.2V ~ 3.6V | 2.5V ~ 5.5V |

---

## I. General Description

The EM78800 is an 8-bit CID (Call Identification) RISC type microprocessor with low power, high speed CMOS technology. Integrated onto a single chip are on-chip watchdog (WDT), RAM, ROM, programmable real time clock /counter, internal interrupt, power down mode, LCD driver, FSK decoder, DTMF generator and tri-state I/O. The EM78800 provides a single chip solution to design a CID of calling message display.

## II. Feature

### CPU

- Operating voltage range : 2.2V ~ 3.6V
- 16K× 13 on chip ROM.
- 2.3K× 8 on chip RAM.
- Up to 28 bi-directional tri-state I/O ports.
- 8 level stack for subroutine nesting.
- 8-bit real time clock/counter (TCC).
- Two sets of 8 bit counters can be interrupt sources.
- Selective signal sources and trigger edges , and with overflow interrupt.
- Programmable free running on chip watchdog timer.
- 99.9% single instruction cycle commands.
- Four modes (Main clock 3.679 , 1.84MHz generated by internal PLL )
  1. Sleep mode: CPU and Main clock turn off, 32.768KHz clock turn off.
  2. Idle mode: CPU and Main clock turn off, 32.768KHz clock turn on.
  3. Green mode: Main clock turn off, CPU and 32.768KHz clock turn on.
  4. Normal mode: Main clock turn on, CPU and 32.768KHz clock turn on.
- Input port wake up function.
- 8 interrupt source , 4 external , 4 internal.
- 100 pin QFP (EM78800AQ POVD disable, EM78800BQ POVD enable).
- 79 pin chip form (EM78800AH POVD disable, EM78800BH POVD enable).
- Port interrupt, pull high and open drain functions.
- Sub-Clock frequency 32.768KHz.

### CID

- Operation Voltage 2.5 ~ 3.5V for FSK.
- Operation Voltage 2.5 ~ 3.5V for DTMF.
- Bell 202, V.23 FSK demodulator.
- DTMF generator.
- Ring detector on chip.

### LCD

- LCD operation voltage chosen by software.
- Common driver pins : 8.
- Segment driver pins : 28 (SEG4 to SEG31).
- 1/4 bias.
- 1/8 duty.

## III. Application

1. Adjunct units.
2. Answering machines.
3. Feature phones.

## IV. Pin Configuration

EM78800AQ, EM78800BQ

## VI. Pin Descriptions

| PIN                          | I/O  | DESCRIPTION   |
|------------------------------|--|---|
| VDD                          | POWER  | digital power   |
| AVDD                         |  | analog power  |
| GND                          | POWER  | Digital ground  |
| AVSS                         |  | Analog ground   |
| Xtin                         | I  | Input pin for 32.768KHz oscillator  |
| Xtout                        | O  | Output pin for 32.768KHz oscillator   |
| COM0...COM7                  | O  | Common driver pins of LCD drivers   |
| SEG4...SEG31                 | O  | Segment driver pins of LCD drivers  |
| PLLC                         | I  | Phase loop lock capacitor, connect a capacitor 0.01u to 0.047u with AVSS  |
| TIP                          | I  | Should be connected with TIP side of twisted pair lines   |
| RING                         | I  | Should be connected with TIP side of twisted pair lines   |
| RDET1                        | I  | Detect the energy on the twisted pair lines. These two pins coupled to the twisted pair lines through an attenuating network. |
| RING TIME                    | I  | Determine if the incoming ring is valid. A RC network may be connected to the pin.  |
| INT0<br>INT1<br>INT2<br>INT3 | PORT7(0)<br>PORT7(1)<br>PORT7(2)<br>PORT7(3) | PORT7 (0) ~ PORT7 (3) signal can be interrupt signals.  |
| P6.0 ~P6.7                   | PORT6  | PORT 6 can be INPUT or OUTPUT port each bit.  |
| P7.0 ~P7.7                   | PORT7  | PORT 7 can be INPUT or OUTPUT port each bit.<br>Internal Pull high function.<br>Bit6,7 open drain function                    |
| P8.0 ~P8.7                   | PORT8  | PORT 8 can be INPUT or OUTPUT port each bit.  |
| P9.0 ~P9.3                   | PORT9  | PORT 9 can be INPUT or OUTPUT port each bit.<br>And can be set to wake up watch dog timer.                                    |
| TEST                         | I  | Test pin into test mode , normal low  |
| DTMF                         | O  | DTMF tone output  |
| /RESET                       | I  |   |

## VII. Functional Descriptions

### VII.1 Operational Registers

1. R0 (Indirect Addressing Register)
  - \* R0 is not a physically implemented register. It is useful as indirect addressing pointer. Any instruction using R0 as register actually accesses data pointed by the RAM Select Register (R4).
2. R1 (TCC)
  - \* Increased by an external signal edge applied to TCC, or by the instruction cycle clock.
  - Written and read by the program as any other register.
3. R2 (Program Counter)
  - \* The structure is depicted in Fig. 4.
  - \* Generates  $16K \times 13$  on-chip ROM addresses to the relative programming instruction codes.
  - \* "JMP" instruction allows the direct loading of the low 10 program counter bits.
  - \* "CALL" instruction loads the low 10 bits of the PC, PC+1, and then push into the stack.
  - \* "RET" ("RETL k", "RETI") instruction loads the program counter with the contents at the top of stack.
  - \* "MOV R2, A" allows the loading of an address from the A register to the PC, and the ninth and tenth bits are cleared to "0".

- \* "ADD R2, A" allows a relative address be added to the current PC, and contents of the ninth and tenth bits are cleared to "0".
- \* "TBL" allows a relative address be added to the current PC, and contents of the ninth and tenth bits don't change. The most significant bit (A10~A13) will be loaded with the content of bit PS0~PS3 in the status register (R5) upon the execution of a "JMP", "CALL", "ADD R2, A", or "MOV R2, A" instruction.

Fig.4 Program counter organization

Fig.5 Data memory configuration

#### 4. R3 (Status Register)

| 7 | 6    | 5 | 4 | 3 | 2 | 1  | 0 |
|---|------|---|---|---|---|----|---|
| - | PAGE | - | T | P | Z | DC | C |

\* Bit 0 (C) Carry flag

\* Bit 1 (DC) Auxiliary carry flag

\* Bit 2 (Z) Zero flag

\* Bit 3 (P) Power down bit. Set to 1 during power on or by a "WDTC" command and reset to 0 by a "SLEP" command.

\* Bit 4 (T) Time-out bit. Set to 1 by the "SLEP" and "WDTC" command, or during power up and reset to 0 by WDT timeout.

| EVENT                         | T | P | REMARK          |
|-------------------------------|---|---|-----------------|
| WDT wake up from sleep mode   | 0 | 0 |                 |
| WDT time out (not sleep mode) | 0 | 1 |                 |
| /RESET wake up from sleep     | 1 | 0 |                 |
| power up                      | 1 | 1 |                 |
| Low pulse on /RESET           | x | x | x .. don't care |

\* Bit 5 unused

\* Bit 6 PAGE: change IOCB ~ IOCE to another page , 0/1 => page0 / page1

\* Bit 7 unused

#### 5. R4 (RAM Select Register)

- \* Bits 0 ~ 5 are used to select up to 64 registers in the indirect addressing mode.
- \* Bits 6 ~ 7 determine which bank is activated among the 4 banks.
- \* See the configuration of the data memory in Fig. 5.

#### 6. R5 (Program Page Select Register)

|   |   |   |   |     |     |     |     |
|---|---|---|---|-----|-----|-----|-----|
| 7 | 6 | 5 | 4 | 3   | 2   | 1   | 0   |
| - | - | - | - | PS3 | PS2 | PS1 | PS0 |

\* Bit 0 (PS0) ~ 3 (PS3) Page select bits

Page select bits

| PS3 | PS2 | PS1 | PS0 | Program memory page (Address) |
|-----|-----|-----|-----|-------------------------------|
| 0   | 0   | 0   | 0   | Page 0                        |
| 0   | 0   | 0   | 1   | Page 1                        |
| 0   | 0   | 1   | 0   | Page 2                        |
| 0   | 0   | 1   | 1   | Page 3                        |
| 0   | 1   | 0   | 0   | Page 4                        |
| 0   | 1   | 0   | 1   | Page 5                        |
| 0   | 1   | 1   | 0   | Page 6                        |
| 0   | 1   | 1   | 1   | Page 7                        |
| 1   | 0   | 0   | 0   | Page 8                        |
| 1   | 0   | 0   | 1   | Page 9                        |
| 1   | 0   | 1   | 0   | Page 10                       |
| 1   | 0   | 1   | 1   | Page 11                       |
| 1   | 1   | 0   | 0   | Page 12                       |
| 1   | 1   | 0   | 1   | Page 13                       |
| 1   | 1   | 1   | 0   | Page 14                       |
| 1   | 1   | 1   | 1   | Page 15                       |

\*User can use PAGE instruction to change page. To maintain program page by user. Otherwise, user can use far jump (FJMP) or far call (FCALL) instructions to program user's code. And the program page is maintained by EMC's compiler. It will change user's program by inserting instructions within program.

\*Bit4~7: unused

#### 6. R6, R7, R8, R9(3:0) (Port 6 , Port7, Port8, Port 9(3:0))

\*Three 8-bit I/O registers (Port6, Port7 and Port8).

\*One 4-bit I/O registers (Port 9(3:0)). R9 (7:4) is a general register.

#### 7. RA (FSK Status Register)(bit 0,1,2 read only)

|      |         |   |    |         |      |     |     |
|------|---------|---|----|---------|------|-----|-----|
| 7    | 6       | 5 | 4  | 3       | 2    | 1   | 0   |
| IDLE | /CLKSEL | 0 | -- | /FSKPWR | DATA | /CD | /RD |

\* Bit0 (Read Only)(Ring detect signal) 0/1: Ring Valid/Ring Invalid

\* Bit1 (Read Only)(Carrier detect signal) 0/1: Carrier Valid/Carrier Invalid

\* Bit2 (Read Only)(FSK demodulator output signal)

FSK data transmitted in a baud rate 1200 Hz. Data from FSK demodulator when /CD is low.

\* Bit3 (read/write)(FSK block power up signal)

1/0: FSK demodulator block power up/FSK demodulator power down

\* The relation between Bit0 to Bit3 is shown in Fig.6.

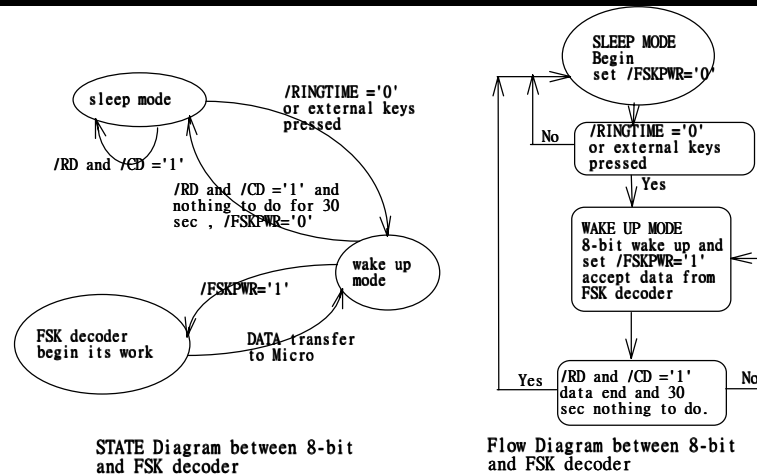

Fig6. The relation between Bit0 to Bit3.

\* Bit4: unused.

\* Bit5: unused. (Must set to "0" by S/W)

\* Bit6 (read/write)(PLL enable signal)

0/1=DISABLE/ENABLE

The relation between 32.768K and Main clock can see Fig7.

Fig7. The relation between 32.768K and Main clock

\* Bit7 IDLE: sleep mode selection bit

0/1=sleep mode/IDLE mode. This bit will decide SLEP instruction which mode to go.

These two modes can be waken up by TCC clock or Watch Dog or PORT9 and run from "SLEP" next instruction.

|               | SLEEP mode              | IDLE mode                                    | GREEN mode               | NORMAL mode              |
|---------------|-------------------------|--|--------------------------|--------------------------|
|               | RA(7,6)=(0,0)<br>+ SLEP | RA(7,6)=(1,0)<br>+ SLEP                      | RA(7,6)=(x,0)<br>no SLEP | RA(7,6)=(x,1)<br>no SLEP |
| TCC time out  | X                       | Wake-up<br>+ Interrupt<br>+ Next instruction | Interrupt                | Interrupt                |
| WDT time out  | RESET                   | Wake-up<br>+ Next instruction                | RESET                    | RESET                    |
| Port9 wake-up | RESET                   | Wake-up<br>+ Next instruction                | RESET                    | RESET                    |

Example: (How to release from IDLE with a TCC timer. P90 is an input key and user can change P90 with RINGTIME pin or other pin of PORT9.)

    MOV TCC,A                      ;WRITE TO TCC
    BC FLAGREG,INC_FLAG           ;CLEAR INC FLAG
    NOP
    JMP LOOP
;==END IDLE mode =====

```

#### 8. RB (DTMF tone row and column register) (read/write)

|    |    |    |    |    |    |    |    |
|----|----|----|----|----|----|----|----|
| 7  | 6  | 5  | 4  | 3  | 2  | 1  | 0  |
| c7 | c6 | c5 | c4 | r3 | r2 | r1 | r0 |

\* Bit 0 - Bit 3 are row-frequency tone.

\* Bit 4 - Bit 7 are column-frequency tone.

\* Initial RB is equal to high. Bit 7 ~ 0 are all "1", turn off DTMF power .

| Bit 3~0      | Row Freq. |        |          |        |          |
|--------------|-----------|--------|----------|--------|----------|
| 1110         | 699.2Hz   | 1      | 2        | 3      | A        |
| 1101         | 771.6Hz   | 4      | 5        | 6      | B        |
| 1011         | 854Hz     | 7      | 8        | 9      | C        |
| 0111         | 940.1Hz   | *      | 0        | #      | D        |
| Column Freq. |           | 1203Hz | 1331.8Hz | 1472Hz | 1645.2Hz |
| Bit 7~4      |           | 1110   | 1101     | 1011   | 0111     |

#### 9. RC (CALLER ID address)(read/write)

|       |       |       |       |       |       |       |       |
|-------|-------|-------|-------|-------|-------|-------|-------|
| 7     | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| CIDA7 | CIDA6 | CIDA5 | CIDA4 | CIDA3 | CIDA2 | CIDA1 | CIDA0 |

\* Bit 0 ~ Bit 7 select CALLER ID RAM address up to 256.

10. RD (CALLER ID RAM data)(read/write)

- \* Bit0 ~ Bit8 are CALLER ID RAM data transfer register.
- User can see IOCA register how to select CID RAM banks.

11. RE (LCD Driver, WDT Control)(read/write)

|   |       |   |        |         |        |        |   |
|---|-------|---|--------|---------|--------|--------|---|
| 7 | 6     | 5 | 4      | 3       | 2      | 1      | 0 |
| - | /WDTE | 0 | /WUP9L | /WURING | LCD_C2 | LCD_C1 | 1 |

\* Bit0 set to "1" always.

\* Bit1~Bit2 (LCD\_C#): LCD\_C# decides the LCD display enable or blanking. Change the display duty must set the "LCD\_C2, LCD\_C1" to "00".

| LCD_C2,LCD_C1 | LCD Display Control   | duty | bias |
|---------------|-----------------------|------|------|
| 0 0           | Disable(turn off LCD) | 1/8  | 1/4  |
| 0 1           | Blanking              | :    | :    |
| 1 1           | LCD display enable    | :    | :    |

\* Bit3 (/WURING, RING Wake Up Enable): used to enable the wake-up function of /RINGTIME input pin.

(1/0=enable/disable)

\* Bit4 (/WUP9L, PORT9 low nibble Wake-Up Enable): used to enable the wake-up function of low nibble in PORT9.

(1/0=enable/disable)

\* Bit5 set to "0" always.

\* Bit6 (/WDTE, Watch Dog Timer Enable)

Control bit used to enable Watchdog timer. (1/0=enable/disable)

The relation between Bit3 to Bit6 can see the diagram 9.

\* Bit7: unused

fig.8 Wake up function and control signal

12. RF (Interrupt Status Register)

|      |         |      |      |      |      |      |      |
|------|---------|------|------|------|------|------|------|
| 7    | 6       | 5    | 4    | 3    | 2    | 1    | 0    |
| INT3 | FSKDATA | C8_2 | C8_1 | INT2 | INT1 | INT0 | TCIF |

- \* "1" means interrupt request, "0" means non-interrupt
- \* Bit 0 (TCIF) TCC timer overflow interrupt flag. Set when TCC timer overflows.
- \* Bit 1 (INT0) external INT0 pin interrupt flag.
- \* Bit 2 (INT1) external INT1 pin interrupt flag.
- \* Bit 3 (INT2) external INT2 pin interrupt flag.
- \* Bit 4 (C8\_1) internal 8 bit counter interrupt flag.
- \* Bit 5 (C8\_2) internal 8 bit counter interrupt flag.
- \* Bit 6 (FSKDATA) FSK data interrupt flag.
- \* Bit 7 (INT3) external INT3 pin interrupt flag.
- \* High to low edge trigger, refer to the Interrupt subsection.
- \* IOCF is the interrupt mask register. User can read and clear.

13. R10~R3F (General Purpose Register)

- \* R10~R3F (Banks 0~3) all are general purpose registers.

## VII.2 Special Purpose Registers

### 1. A (Accumulator)

- \* Internal data transfer, or instruction operand holding
- \* It's not an addressable register.

### 2. CONT (Control Register)

|   |     |    |   |     |      |      |      |
|---|-----|----|---|-----|------|------|------|
| 7 | 6   | 5  | 4 | 3   | 2    | 1    | 0    |
| - | INT | TS | - | PAB | PSR2 | PSR1 | PSR0 |

\* Bit 0 (PSR0) ~ Bit 2 (PSR2) TCC/WDT prescaler bits.

| PSR2 | PSR1 | PSR0 | TCC Rate | WDT Rate |
|------|------|------|----------|----------|
| 0    | 0    | 0    | 1:2      | 1:1      |
| 0    | 0    | 1    | 1:4      | 1:2      |
| 0    | 1    | 0    | 1:8      | 1:4      |
| 0    | 1    | 1    | 1:16     | 1:8      |
| 1    | 0    | 0    | 1:32     | 1:16     |
| 1    | 0    | 1    | 1:64     | 1:32     |
| 1    | 1    | 0    | 1:128    | 1:64     |
| 1    | 1    | 1    | 1:256    | 1:128    |

\* Bit 3 (PAB) Prescaler assignment bit.

0/1: TCC/WDT

\* Bit 4 unused

\* Bit 5 (TS) TCC signal source

0: internal instruction cycle clock

1: 16.38KHz

\* Bit 6: (INT) INT enable flag

0: interrupt masked by DISI or hardware interrupt

1: interrupt enabled by ENI/RETI instructions

\* Bit 7: unused

\* CONT register is readable and writable.

### 3. IOC6, IOC7, IOC8, IOC9 (3:0) (I/O Port Control Register)

- \* IOC6, IOC7, IOC8, IOC9 (3:0) are the I/O direction control register.
- \* "1" put the relative I/O pin into high impedance (input port), while "0" put the relative I/O pin as output port.
- \* IOC9 (7:4) = "0000" always.

### 4. IOCA (CALLER ID RAM, IO, PAGE Control Register)(read/write, initial "00000000")

|   |   |   |   |        |        |        |   |
|---|---|---|---|--------|--------|--------|---|
| 7 | 6 | 5 | 4 | 3      | 2      | 1      | 0 |
| 0 | 0 | - | 0 | CALL_3 | CALL_2 | CALL_1 | 0 |

\* Bit0 unused

\* Bit4~Bit1:"000" to "111" are eight blocks of CALLER ID RAM area. User can use 2.0K RAM with RC ram address.

\* Bit 5 unused

\* Bit6: set to "0" always.

\* Bit7: set to "0" always.

## 5. IOCB (LCD ADDRESS)

PAGE0: Bit6 ~ Bit0 = LCDA6 ~ LCDA0

The LCD display data is stored in the data RAM. The relation of data area and COM/SEG pin is as below:

|  |                        |       |
|--|------------------------|-------|
|  | COM7 ~ COM0            |       |
|  | Address0 (Bit7 ~ Bit0) | Empty |
|  | Address1               | Empty |
|  | Address2               | Empty |
|  | Address3               | Empty |
|  | Address4               | SEG4  |
|  | :                      | :     |
|  | Address31              | SEG31 |
|  | Address32              | Empty |
|  | Address33              | Empty |
|  | :                      | Empty |
|  | Address128             | Empty |

PAGE1: 8 bit up-counter (COUNTER1) preset and read out register (write = preset). After an interruption, it will count from "00".

## 6. IOCC (LCD DATA)

PAGE0: Bit7 ~ Bit0 = LCD RAM data register

PAGE1: 8 bit up-counter (COUNTER2) preset and read out register (write = preset). After an interruption, it will count from "00".

## 7. IOCD (Pull-high Control Register)

PAGE0:

|     |     |     |     |     |     |     |     |
|-----|-----|-----|-----|-----|-----|-----|-----|
| 7   | 6   | 5   | 4   | 3   | 2   | 1   | 0   |
| PH7 | PH6 | PH5 | PH4 | PH3 | PH2 | PH1 | PH0 |

\* Bit 0 ~ 7 (/PH#) Control bit used to enable the pull-high of PORT7 (#) pin.

1: Enable internal pull-high

0: Disable internal pull-high

## 8. IOCE (Bias, PLL Control Register)

PAGE0:

|   |   |   |       |       |       |   |   |
|---|---|---|-------|-------|-------|---|---|
| 7 | 6 | 5 | 4     | 3     | 2     | 1 | 0 |
| 0 | 0 | 0 | Bias3 | Bias2 | Bias1 | 0 | 0 |

\* Bit 0: set to '0' always

\* Bit 1: set to '0' always

\* Bit 2~4 (Bias1~Bias3) Control bits used to choose LCD operation voltage.

| LCD operate voltage | Vop (VDD 3.3V) | VDD=3.3V |
|---------------------|----------------|----------|
| 000                 | 0.60VDD        | 1.98V    |
| 001                 | 0.66VDD        | 2.18V    |
| 010                 | 0.74VDD        | 2.44V    |
| 011                 | 0.82VDD        | 2.71V    |
| 100                 | 0.87VDD        | 2.87V    |
| 101                 | 0.93VDD        | 3.07V    |
| 110                 | 0.96VDD        | 3.17V    |
| 111                 | 1.00VDD        | 3.3V     |

\* Bit 5: set to '0' always

- \* Bit 6: set to '0' always
- \* Bit 7: set to '0' always

PAGE1:

|      |      |     |     |      |      |      |   |
|------|------|-----|-----|------|------|------|---|
| 7    | 6    | 5   | 4   | 3    | 2    | 1    | 0 |
| OP77 | OP76 | C2S | C1S | PSC1 | PSC0 | CDRD | - |

- \* Bit0: unused
- \* Bit1: cooked data or raw data select bit, 0/1 ==> cooked data/raw data
- \* Bit3~Bit2: counter1 prescaler, reset = (0,0)  
(PSC1, PSC0) = (0,0)=>1:1, (0,1)=>1:2, (1,0)=>1:4, (1,1)=>1:8.
- \* Bit4: counter1 source, (0/1)=(32768Hz/Main clock if enable)
- \* Bit5: counter2 source, (0/1)=(32768Hz/Main clock if enable). Scale=1:1
- \* Bit6: P76 open drain control (0/1)=(disable/enable)
- \* Bit7: P77 open drain control (0/1)=(disable/enable)

#### 9. IOCF (Interrupt Mask Register)

|      |         |      |      |      |      |      |      |
|------|---------|------|------|------|------|------|------|
| 7    | 6       | 5    | 4    | 3    | 2    | 1    | 0    |
| INT3 | FSKDATA | C8_2 | C8_1 | INT2 | INT1 | INT0 | TCIF |

- \* Bit 0 ~ 7 interrupt enable bit.  
0: disable interrupt  
1: enable interrupt
- \* IOCF Register is readable and writable.

## VII.3 TCC/WDT Prescaler

There is an 8-bit counter available as prescaler for the TCC or WDT. The prescaler is available for the TCC only or WDT only at the same time.

- An 8 bit counter is available for TCC or WDT determined by the status of the bit 3 (PAB) of the CONT register.
- See the prescaler ratio in CONT register.
- Fig. 12 depicts the circuit diagram of TCC/WDT.
- Both TCC and prescaler will be cleared by instructions which write to TCC each time.
- The prescaler will be cleared by the WDTC and SLEP instructions, when assigned to WDT mode.
- The prescaler will not be cleared by SLEP instructions, when assigned to TCC mode.

Fig. 12 Block diagram of TCC WDT

## VII.4 I/O Ports

The I/O registers, Port 6 ~ Port 9, are bi-directional tri-state I/O ports. Port 7 can be pulled-high internally by software control. The I/O ports can be defined as "input" or "output" pins by the I/O control registers (IOC6 ~ IOC9) under program control. The I/O registers and I/O control registers are both readable and writable. The I/O interface circuit is shown in Fig.13.

Fig. 13 The circuit of I/O port and I/O control register

## VII.5 RESET and Wake-up

The RESET can be caused by

- (1) Power on reset, or Voltage detector
- (2) WDT timeout. (If enabled and in GREEN or NORMAL mode)

Note that only Power on reset, or only Voltage detector in Case (1) is enabled in the system by CODE Option bit. If Voltage detector is disabled, Power on reset is selected in Case (1). Refer to Fig. 14.

Fig. 14 Block diagram of Reset of controller

Once the RESET occurs, the following functions are performed.

- The oscillator is running, or will be started.
- The Program Counter (R2) is set to all "0".
- When power on, the upper 3 bits of R3 and the upper 2 bits of R4 are cleared.
- The Watchdog timer and prescaler are cleared.
- The Watchdog timer is disabled.
- The CONT register is set to all "1"
- The other register (bit7...bit0)

|                 |                         |                         |
|-----------------|-------------------------|-------------------------|
| R5 = "00000000" |                         |                         |
| R6 = PORT       | IOC6 = "11111111"       |                         |
| R7 = PORT       | IOC7 = "11111111"       |                         |
| R8 = PORT       | IOC8 = "11111111"       |                         |
| R9(3:0) = PORT  | IOC9 = "00001111"       |                         |
| RA = "010x0xxx" | IOCA = "00000000"       |                         |
| RB = "11111111" | Page0 IOCB = "00000000" | Page1 IOCB = "00000000" |
| RC = "00000000" | Page0 IOCC = "0xxxxxxx" | Page1 IOCC = "00000000" |
| RD = "xxxxxxx"  | Page0 IOCD = "00000000" |                         |
| RE = "00000001" | Page0 IOCE = "00000000" | Page1 IOCE = "00000000" |
| RF = "00000000" | IOCF = "00000000"       |                         |

The controller can be awakened from SLEEP mode or IDLE mode (execution of "SLEP" instruction, named as SLEEP MODE or IDLE mode) by (1) TCC time out (IDLE mode only) (2) WDT time-out (if enabled) or, (3) external input at PORT9 (4) RINGTIME pin. The four cases will cause the controller wake up and run from next instruction in IDLE mode, reset in SLEEP mode. After wake-up, user should control WATCH DOG in case of reset in GREEN mode or NORMAL mode. The last three should be open RE register before into SLEEP mode or IDLE mode. The first one case will set a flag in RF bit0. And it will go to address 0x08 when TCC generate a interrupt.

## VII.6 Interrupt

The CALLER ID IC has internal interrupts which are falling edge triggered, as followed: TCC timer overflow interrupt (internal) , two 8-bit counters overflow interrupt .

If these interrupt sources change signal from high to low, then RF register will generate 'I' flag to corresponding register if you enable IOCF register.

RF is the interrupt status register which records the interrupt request in flag bit. IOCF is the interrupt mask register. Global interrupt is enabled by ENI instruction and is disabled by DISI instruction. When one of the interrupts (when enabled) generated, will cause the next instruction to be fetched from address 008H. Once in the interrupt service routine the source of the interrupt can be determined by polling the flag bits in the RF register. The interrupt flag bit must be cleared in software before leaving the interrupt service routine and enabling interrupts to avoid recursive interrupts.

There are four external interrupt pins including INT0, INT1, INT2 and INT3. And four internal counter interrupt available.

External interrupt INT0, INT1, INT2 and INT3 signals are from PORT7 bit0 to bit3. If IOCF is enable then these signal will cause interrupt, or these signals will be treated as general input data.

After reset, the next instruction will be fetched from address 000H and the instruction interrupt is 001H and the hardware interrupt is 008H.

TCC will go to address 0x08 in GREEN mode or NORMAL mode after time out. And it will run next instruction from "SLEP" instruction and then go to address 0x08 in IDLE mode. These two cases will set a RF flag.

## VII.7 Instruction Set

Instruction set has the following features:

- (1). Every bit of any register can be set, cleared, or tested directly.
- (2). The I/O register can be regarded as general register. That is, the same instruction can operates on I/O register.

The symbol "R" represents a register designator which specifies which one of the 64 registers (including operational registers and general purpose registers) is to be utilized by the instruction. Bits 6 and 7 in R4 determine the selected register bank. "b" represents a bit field designator which selects the number of the bit, located in the register "R", affected by the operation. "k" represents an 8 or 10-bit constant or literal value.

| INSTRUCTION BINARY | HEX  | MNEMONIC | OPERATION                               | STATUS AFFECTED |
|--------------------|------|----------|---|-----------------|
| 0 0000 0000 0000   | 0000 | NOP      | No Operation                            | None            |
| 0 0000 0000 0001   | 0001 | DAA      | Decimal Adjust A                        | C               |

## VII.8 CODE Option Register

The CALLER ID IC has one CODE option register which is not part of the normal program memory. The option bits cannot be accessed during normal program execution.

|   |   |   |   |   |   |       |      |
|---|---|---|---|---|---|-------|------|
| 7 | 6 | 5 | 4 | 3 | 2 | 1     | 0    |
| - | - | - | - | - | - | /POVD | MCLK |

\* Bit 0 (MCLK): Main clock selection, 0/1 = 3.679MHz/1.84MHz

\* Bit 1 (/POVD): Power on voltage detector.

0: enable

1: disable

|   | 2V POVD<br>reset | 1.7V power on<br>reset | sleep mode current<br>(VDD=3.3V) |
|---|------------------|------------------------|----------------------------------|
| 1 | no               | yes                    | 4uA (Typical)                    |
| 0 | yes              | yes                    | 15uA (Typical)                   |

\* Bits 2~7: unused, must be "0"s.

## VII.9 FSK FUNCTION

### VII.9.1 Functional Block Diagram

Fig15. FSK Block Diagram

### VII.9.2 Function Descriptions

The CALLER ID IC is a CMOS device designed to support the Caller Number Deliver feature which is offered by the Regional Bell Operating Companies. The FSK block comprises two paths: the signal path and the ring indicator path. The signal path consist of an input differential buffer, a band pass filter, an FSK demodulator and a data valid with carrier detect circuit. The ring detector path includes a clock generator, a ring detect circuit.

In a typical application, the ring detector maintains the line continuously while all other functions of the chip are inhibited. If a ring signal is sent, the /RINGTIME pin will has a low signal. User can use this signal to wake up whole chip or read /RD signal from RA register.

A /FSKPWR input is provided to activate the block regardless of the presence of a power ring signal. If /FSKPWR is sent low, the FSK block will power down whenever it detects a valid ring signal, it will power on when /FSKPWR is high.

The input buffer accepts a differential AC coupled input signal through the TIP and RING input and feeds this signal to a band pass filter. Once the signal is filtered, the FSK demodulator decodes the information and sends it to a post filter. The output data is then made available at DATA OUT pin. This data, as sent by the central office, includes the header information (alternate "1" and "0") and 150 ms of marking which precedes the date, time and calling number. If no data is present, the DATA OUT pin is held in a high state. This is accomplished by a carrier detect circuit which determines if the in-band energy is high enough. If the incoming signal is valid and thus the demodulated data is transferred to DATA OUT pin. If it is not, then the FSK demodulator is blocked.

### VII.9.3 Ring detect circuit

When VDD is applied to the circuit, the RC network will charge cap C1 to VDD holding /RING TIME off. The resistor network R2 to R3 attenuates the incoming power ring applied to the top of R2. The values given have been chosen to provide a sufficient voltage at DET1 pin, to turn on the Schmitt trigger input. When  $V_{t+}$  of the Schmitt is exceeded, cap C1 will discharge.

The value of R1 and C1 must be chosen to hold the /RING TIME pin voltage below the  $V_{t+}$  of the Schmitt between the individual cycle of the power ring. With /RINGTIME enabled, this signal will be a /RD signal in RA through a buffer.

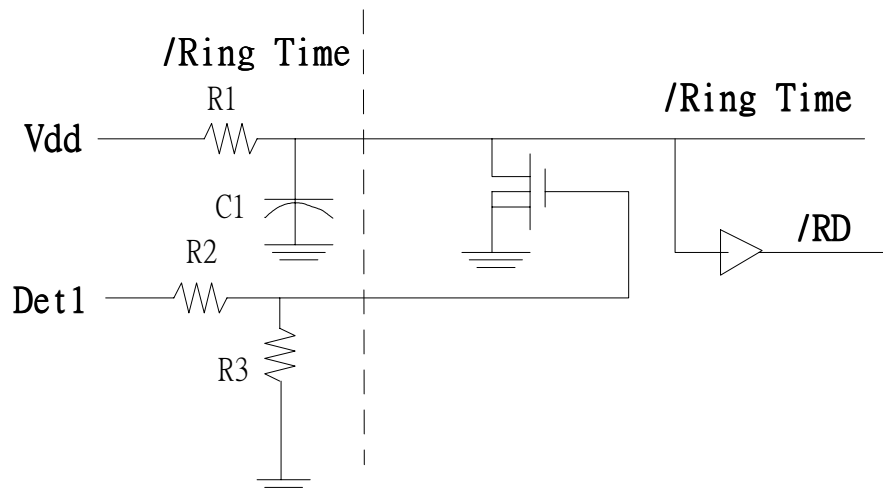

Fig16. Ring detect circuit

## VII.10 DTMF ( Dual Tone Multi Frequency ) Tone Generator

Built-in DTMF generator can generate dialing tone signals for telephone of dialing tone type. There are two kinds of DTMF tone. One is the group of row frequency, the other is the group of column frequency, each group has 4 kinds of frequency, user can get 16 kinds of DTMF frequency totally. DTMF generator contains a row frequency sine wave generator for generating the DTMF signal which selected by low order 4 bits of RB and a column frequency sine wave generator for generating the DTMF signal which selected by high order 4 bits of RB. This block can generate single tone by filling one bit zero to this register.

If all the values are high, the power of DTMF will turn off until one or two low values.

Either high or low 4 bits must be set by an effective value, otherwise, if any ineffective value or both 4 bits are load effective value, tone output will be disable. Recommend value refer to table as follow please:

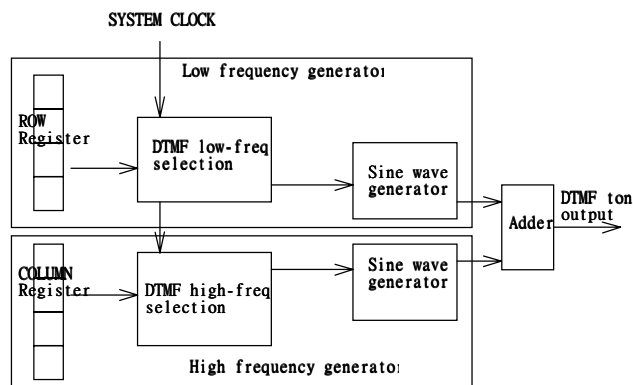

Fig17. DTMF Block Diagram

### \* RB ( DTMF Register )

- . Bit0 - Bit3 are row-frequency tone.
- . Bit4 - Bit7 are column-frequency tone.
- . Initial RB is equal to HIGH.
- . Except below values of RB, the other values of RB are not effect. If RB is set by ineffective value, the DTMF output will be disable and there is no tone output.
- . Bit7 ~ 0 are all "1", turn off DTMF power.

| bit 3~0      | Row Freq. |        |          |        |          |
|--------------|-----------|--------|----------|--------|----------|
| 1110         | 699.2Hz   | 1      | 2        | 3      | A        |
| 1101         | 771.6Hz   | 4      | 5        | 6      | B        |
| 1011         | 854Hz     | 7      | 8        | 9      | C        |
| 0111         | 940.1Hz   | *      | 0        | #      | D        |
| Column Freq. |           | 1203Hz | 1331.8Hz | 1472Hz | 1645.2Hz |
| bit 7~4      |           | 1110   | 1101     | 1011   | 0111     |

## VII.11 LCD Driver

The CALLER ID IC can drive LCD directly and has 28 segments and 8 commons that can drive 28\*8 dots totally. LCD block is made up of LCD driver, display RAM, segment output pins, common output pins and LCD operating power supply pins.

Duty, bias, the number of segment, the number of common and frame frequency are determined by LCD mode register. LCD control register.

The basic structure contains a timing control which uses the basic frequency 32.768KHz to generate the proper timing for different duty and display access. RE register is a command register for LCD driver, the LCD display(disable, enable, blanking) is controlled by LCD\_C and the driving duty and bias is decided by LCD\_M and the display data is stored in data RAM which address and data access controlled by registers RC and RD.

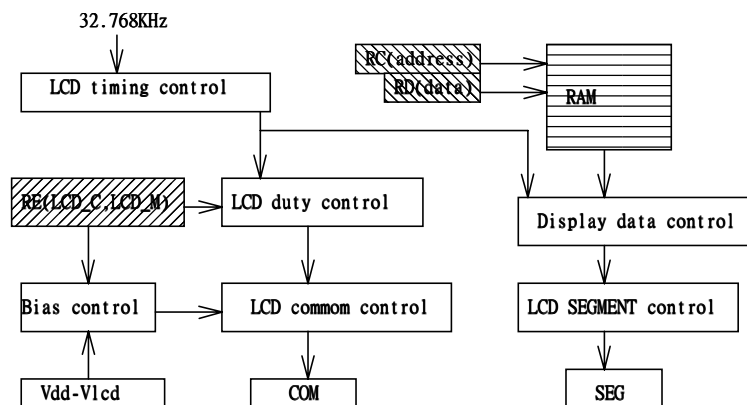

Fig18. LCD DRIVER CONTROL

### VII.11.1 LCD Driver Control

#### 1. RE (LCD Driver Control)(initial state "00000000")

|   |   |   |   |   |        |        |   |
|---|---|---|---|---|--------|--------|---|
| 7 | 6 | 5 | 4 | 3 | 2      | 1      | 0 |
| - | - | - | - | - | LCD_C2 | LCD_C1 | 1 |

\*Bit1~Bit2 (LCD\_C#): LCD\_C# decides the LCD display enable or blanking. Change the display duty must set the LCD\_C to "00".

| LCD_C2,LCD_C1 | LCD Display Control                  | duty | bias |
|---------------|--------------------------------------|------|------|
| 0 0           | change duty<br>Disable(turn off LCD) | 1/8  | 1/4  |
| 0 1           | Blanking                             | :    | :    |
| 1 1           | LCD display enable                   | :    | :    |

### VII.11.2 LCD display area

The LCD display data is stored in the data RAM. The relation of data area and COM/SEG pin is as below:

| COM7 ~ COM0            |       |
|------------------------|-------|
| Address0 (Bit7 ~ Bit0) | Empty |
| Address1               | Empty |
| Address2               | Empty |
| Address3               | Empty |
| Address4               | SEG4  |
| :                      | :     |
| Address31              | SEG31 |
| Address32              | Empty |
| Address33              | Empty |

|  |            |       |
|--|------------|-------|
|  | :          | Empty |
|  | Address128 | Empty |

\*IOCB (LCD Display RAM address)

|   |       |       |       |       |       |       |       |
|---|-------|-------|-------|-------|-------|-------|-------|
| 7 | 6     | 5     | 4     | 3     | 2     | 1     | 0     |
| - | LCDA6 | LCDA5 | LCDA4 | LCDA3 | LCDA2 | LCDA1 | LCDA0 |

Bit 0 ~ Bit 6 select LCD Display RAM address up to 29.

LCD RAM can be write whether in enable or disable mode and read only in disable mode.

\*IOCC (LCD Display data): Bit0 ~ Bit8 are LCD data.

### VII.11.3 LCD COM and SEG signal

\* COM signal: The number of COM pins are according to the duty cycle used, as following is in 1/8 duty mode.

|     |      |      |      |      |      |      |      |      |
|-----|------|------|------|------|------|------|------|------|
|     | COM0 | COM1 | COM2 | COM3 | COM4 | COM5 | COM6 | COM7 |
| 1/8 | o    | o    | o    | o    | o    | o    | o    | o    |

x: open. o: select.

\* SEG signal: The 28 segment signal pins are connected to the corresponding display RAM address 4 to 31. The high bit and the low bit (bit7 down to bit0) are correlated to COM7 to COM0 respectively.

When a bit of display RAM is 1, a select signal is sent to the corresponding segment pin, and when the bit is 0, a non-select signal is sent to the corresponding segment pin.

\*COM, SEG and Select/Non-select signal is shown as following:

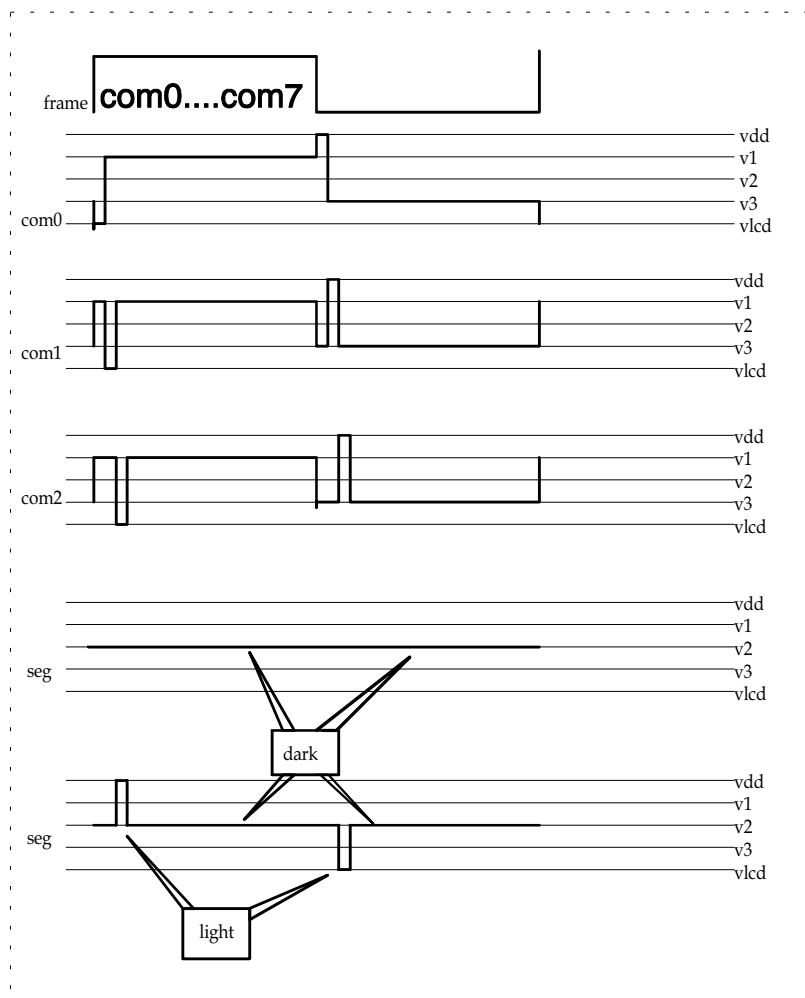

Fig.19 LCD wave 1/4 bias, 1/8 duty

#### VII.11.4 LCD Bias control

IOCE (Bias Control Register)

| 7 | 6 | 5 | 4     | 3     | 2     | 1 | 0 |
|---|---|---|-------|-------|-------|---|---|
|   |   |   | Bias3 | Bias2 | Bias1 |   |   |

- Bit 2~4 (Bias1~Bias3) Control bits used to choose LCD operation voltage. The circuit can refer the Figure15.

| LCD operate voltage | Vop (VDD 3.3V) | VDD=3.3V |
|---------------------|----------------|----------|
| 000                 | 0.60VDD        | 1.98V    |
| 001                 | 0.66VDD        | 2.18V    |
| 010                 | 0.74VDD        | 2.44V    |
| 011                 | 0.82VDD        | 2.71V    |
| 100                 | 0.87VDD        | 2.87V    |
| 101                 | 0.93VDD        | 3.07V    |
| 110                 | 0.96VDD        | 3.17V    |
| 111                 | 1.00VDD        | 3.3V     |

- Bit 5~7 unused

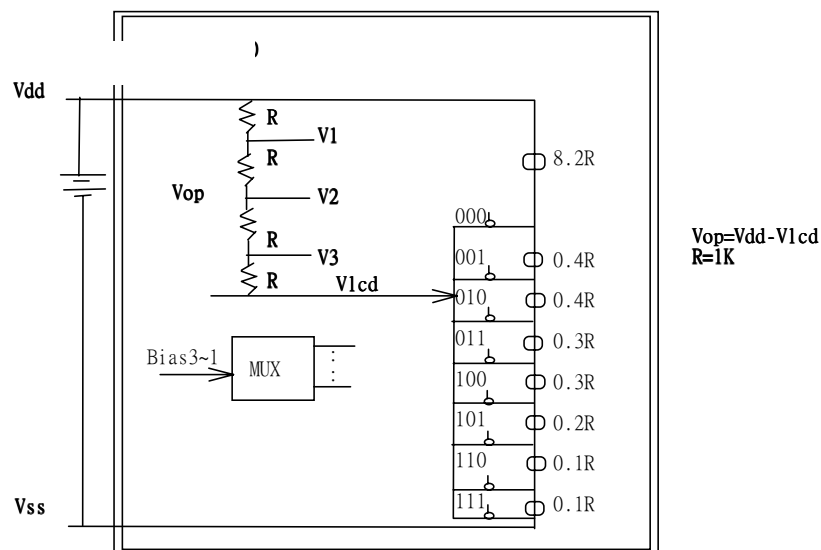

Fig.21 LCD bias circuit

## VIII. Absolute Operation Maximum Ratings

| RATING                      | SYMBOL          | VALUE            | UNIT |
|-----------------------------|-----------------|------------------|------|

| Vmax  | column-frequency tone strength   | Root mean square voltage | 165    | 195 | 225    | mV |

## IX. AC Electrical Characteristic

(Ta=0°C ~ 70°C, VDD=3.3V, VSS=0V)

| Symbol | Parameter              | Conditions            | Min         | Typ       | Max | Unit     |
|--------|------------------------|-----------------------|-------------|-----------|-----|----------|
| Dclk   | Input CLK duty cycle   |                       | 45          | 50        | 55  | %        |
| Tins   | Instruction cycle time | 32.768KHz<br>3.679MHz |             | 60<br>550 |     | us<br>ns |
| Tdrh   | Device delay hold time |                       |             | 18        |     | ms       |
| Ttcc   | TCC input period       | Note 1                | (Tins+20)/N |           |     | ns       |
| Twtd   | Watchdog timer period  | Ta = 25°C             |             | 16        |     | ms       |

Note 1: N= selected prescaler ratio.

(FSK Band Pass Filter AC Characteristic)(Vdd=+3.3V,Ta=+25°C)

| CHARACTERISTIC  | MIN | TYP | MAX | UNIT |
|---|-----|-----|-----|------|
| input sensitivity TIP and RING<br>pin1 and pin2 VDD=+3.3V | -35 | -48 | --  | dBm  |

(FSK AC Characteristic)

| Description                                | Symbol | Min | Typ | Max       | Unit |
|--|--------|-----|-----|-----------|------|
| OSC start up (32.768KHz)<br>(3.679MHz PLL) | Tosc   | --  |     | 400<br>10 | ms   |
| Carrier detect low                         | Tcdl   | --  | 10  | 14        | ms   |
| Data out to Carrier detect low             | Tdoc   | --  | 10  | 20        | ns   |
| Power up low to FSK(setup time)            | Tsup   | --  | 15  | 20        | ms   |
| /RD low to Ringtime low                    | Trd    |     |     | 10        | ms   |
| End of FSK to Carrier Detect high          | Tcdh   | 8   | --  | --        | ms   |

Please watch out the FSK setup time

## XI. Timing Diagrams

### AC Test Input/Output Waveform

AC Testing: Input are driven at 2.4V for logic "1", and 0.45V for logic "0". Timing measurements are made at 2.0V for logic "1", and 0.8V for logic "0".
