

**UA7527**

Preliminary

LINEAR INTEGRATED CIRCUIT**POWER FACTOR
CONTROLLER**■ **DESCRIPTION**

The UTC **UA7527** is a simple and high performance active power factor corrective controller for boost PFC application which operates in the critical conduction mode. The UTC **UA7527** is optimized for electronic ballasts, low power and high density power supplies which require minimum board area reduced component count and low power dissipation. Internal R/C filter eliminates the need for an external R/C filter. Special circuitry has also been added to prevent no load runaway conditions. The output drive clamping circuit limits the overshoot of the power MOSFET gate drive despite the supply voltage. This greatly enhances the system reliability.

SOP-8

■ **FEATURES**

- * Internal Start-up Timer
- * Very Precise Adjustable Output Over Voltage Protection
- * Zero Current Detector
- * Quadrant Multiplier
- * Internal R/C Filter Eliminates the Need for an External R/C Filter
- * Trimmed 1.5% Internal Band Gap Reference
- * Under Voltage Lockout with 3V of Hysteresis
- * Totem Pole Output With High State Clamp
- * Low Start-up and Operating Current

PIN CONFIGURATION

PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	INV	The inverting input of the error amplifier. The output of the boost converter should be resistively divided to 2.5V and connected to this pin.
2	EA_OUT	The error amplifier output. A feedback compensation network is placed between this pin and the INV pin.
3	MULT	Input to the multiplier stage. Full-wave rectified AC voltage is divided into a voltage less than 2V and is connected to this pin.
4	CS	Input of the Pulse-Width Modulation comparator. Current is sensed in the boost stage MOSFET by a resistor in the source lead. An internal R / C filter can filter out any high frequency noise.
5	I _{DET}	Input to zero current detection.
6	GND	The IC ground.
7	OUT	Gate driver output. This pin provides an output to an external Power MOSFET with peak current of 500mA.
8	V _{CC}	The positive supply of the device.
