POWER DISTRIBUTION SWITCH

■ DESCRIPTION

The UTC **US3075-US3375** is a power distribution switch. It particularly designed for self-powered and bus-powered Universal Serial Bus (USB) applications.

The $R_{DS(ON)}$ of the MOSFET switch is as low as 100m Ω . \overline{OC} is open-drain output report over-current or over-temperature event which has deglitch typical 9ms timeout period typically 9ms.

The UTC **US3075-US3375** incorporates protection circuits including current limiting circuit with foldback function, thermal shutdown circuit designed to prevent catastrophic switch failure due to increasing power dissipation when continuous heavy loads or short circuit occurs. Besides, a built-in charge pump is used to drive the N-channel MOSFET that is free of parasitic body diode to eliminate any reversed current flow across the switch when it is powered off.

The UTC **US3075-US3375** is applied in high-side power protection switch, USB power management, USB host and self-powered hubs, USB bus-powered hubs, hot plug-in power supplies, battery-charger circuits.

■ FUNCTIONAL DESCRIPTION

Input and Output

IN pin (Input) is the power supply connection to the logic circuitry and the drain of the output MOSFET. OUT pin (Output) is the source of the output MOSFET. In a typical application, current flows through the switch from input to output toward the load. Both OUT pins must be connected together to the load.

Thermal Shutdown

Thermal shutdown is designed to prevent this device from being damaged due to excessive power dissipation. It is used to turn off the output MOSFET when the if the temperature is higher than 135°C, 20°C of hysteresis prevents the switch turn on until the die temperature drops to 115°C. Thermal shutdown circuit functions only when the switch is enabled.

Under Voltage Lockout

UVLO (Under voltage Lockout) turns off the MOSFET switch once the input voltage falls below 2.3V (TYP.) and if the input voltage exceeds 2.5V (TYP.), the switch will be turned on. UVLO detection functions only when the switch is enabled.

Current Limiting

The current limit value is fixed internally, typically 2A, 1.5A, 1A, 0.75A for **US3375/ US3275/ US3175/ US3075** respectively. There is foldback of current limit When V_{OUT} is less than 1.5V, there is foldback of current limit.

OC Function

The OC open-drain output is asserted (active low) when an over current or over temperature shutdown condition is encountered after a 9-ms deglitch timeout. The output keeps asserted until the over current or over temperature condition is removed.

■ APPLICATION INFORMATION

Supply Filtering

To avoid supply transients, 1μF bypass capacitor is strongly recommended to located between IN to GND. Without a bypass capacitor, an output short may cause sufficient ringing on the input (from supply lead inductance) to damage internal control circuitry.

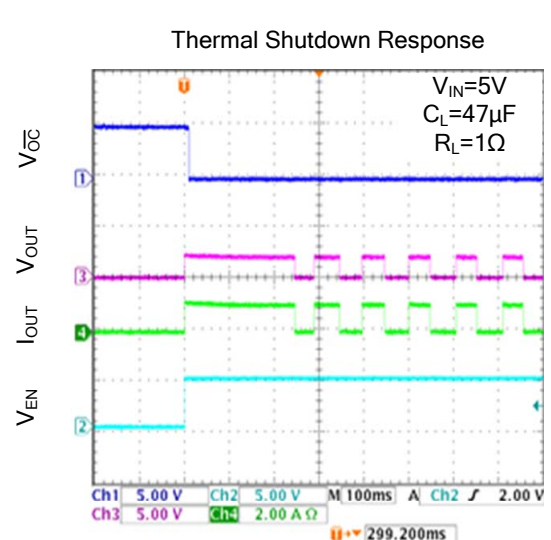

Input transients value must be not higher than the absolute maximum supply voltage ($V_{IN\ max} = 6V$) even for a short duration.

EN, the Enable Input

The enable pin, EN, must be driven logic high or logic low for a clearly defined input. The input is not allowed to float, or unpredictable operation may be occurs. EN should not be allowed to go negative with respect to GND.
