

UTL331/A

LINEAR INTEGRATED CIRCUIT

LOW POWER SINGLE VOLTAGE COMPARATOR

DESCRIPTION

The UTC **UTL331/A** consists of a low power voltage comparator designed specifically for operation from a single supply over a wide range of voltages. Operation from split power supplies is also possible.

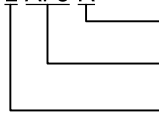

This comparator also has a unique characteristic that the input common-mode voltage range includes ground even though it is operated from a single power supply voltage.

FEATURES

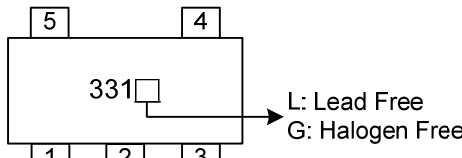

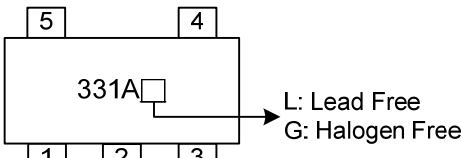

- * Wide single supply voltage range or dual supplies +2V~+36V or $\pm 1V \sim \pm 18V$
- * Very low supply current (0.2mA) independent of supply voltage (1mW /comparator at +5V)
- * Low input bias current: 25nA typ.
- * Low input offset current: $\pm 5nA$ typ.
- * Low input offset voltage: $\pm 1mV$ typ
- * Input common-mode voltage range includes ground.
- * Low output saturation voltage: 250mV typ. ($I_{OUT}=4mA$).
- * Differential input voltage range equal to the supply voltage.
- * TTL, DTL, ECL, CMOS Compatible outputs.

■ ABSOLUTE MAXIMUM RATINGS

PARAMETER	SYMBOL	RATING	UNIT
Supply Voltage	V_{CC}	± 18 or 36	V
Differential Input Voltage	$V_{I(DIFF)}$	± 36	V
Input Voltage	V_{IN}	-0.3 ~ +36	V
Output Short-Circuit to Ground (Note 2)		Infinite	
Power Dissipation	P_D	380	mW
Junction Temperature	T_J	150	°C
Operating Temperature	T_{OPR}	-40 ~ +125	°C
Storage Temperature	T_{STG}	-65 ~ +150	°C

Notes: 1. Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.
 2. Short-circuit from the output to V_{CC} can cause excessive heating and eventual destruction. The maximum output current is approximately 20mA, independent of the magnitude of V_{CC} .

Response Time	t_R	$R_L=5.1\text{k}\Omega$ to V_{CC} (Note 5)		1.3		μs
Large Signal Response Time	t_{REL}	$V_{IN}=TTL$, $V_{REF}=+1.4\text{V}$, $R_L=5.1\text{k}\Omega \sim V_{CC}$		300		ns

Notes: 1. At output switch point, $V_o=1.4\text{V}$, $R_s=0\Omega$ with V_{CC} from 5V ~ 30V and over the full input common-mode range (0V ~ $V_{CC} 1.5\text{V}$).
 2. The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output, so no loading charge exists on the reference or input lines.
 3. The input common-mode voltage of either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is $V_{CC} + -1.5\text{V}$, but either or both inputs can go to +30V without damage.
 4. Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range the comparator will provide a proper output state.
 The low input voltage state must not be less than -0.3V (or 0.3V below the negative power supply, if used).
 5. The response time specified is for a 100mV input step with 5mV overdrive. For larger overdrive signals 300ns can be obtained.
