Functional Description^[1]

The CY62157DV18 is a high-performance CMOS static RAM organized as 512K words by 16 bits. This device features advanced circuit design to provide ultra-low active current. This is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power-down feature that significantly reduces power consumption by 99% when addresses are not toggling. The device can be put into standby mode reducing

power consumption by more than 99% when deselected Chip Enable 1 ($\overline{CE_1}$) HIGH or Chip Enable 2 ($\overline{CE_2}$) LOW or both $\overline{BHE}$ and $\overline{BLE}$ are HIGH. The input/output pins (I/O_0 through I/O_{15}) are placed in a high-impedance state when: deselected Chip Enable 1 ($\overline{CE_1}$) HIGH or Chip Enable 2 ($\overline{CE_2}$) LOW, outputs are disabled ($\overline{OE}$ HIGH), both Byte High Enable and Byte Low Enable are disabled ($\overline{BHE}$, $\overline{BLE}$ HIGH) or during a write operation (Chip Enable 1 ($\overline{CE_1}$) LOW and Chip Enable 2 ($\overline{CE_2}$) HIGH and $\overline{WE}$ LOW).

Writing to the device is accomplished by taking Chip Enable 1 ($\overline{CE_1}$) LOW and Chip Enable 2 ($\overline{CE_2}$) HIGH and Write Enable ($\overline{WE}$) input LOW. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from I/O pins (I/O_0 through I/O_7), is written into the location specified on the address pins (A_0 through A_{18}). If Byte High Enable ($\overline{BHE}$) is LOW, then data from I/O pins (I/O_8 through I/O_{15}) is written into the location specified on the address pins (A_0 through A_{18}).

Reading from the device is accomplished by taking Chip Enable 1 ($\overline{CE_1}$) LOW and Chip Enable 2 ($\overline{CE_2}$) HIGH and Output Enable ($\overline{OE}$) LOW while forcing the Write Enable ($\overline{WE}$) HIGH. If Byte Low Enable ($\overline{BLE}$) is LOW, then data from the memory location specified by the address pins will appear on I/O_0 to I/O_7 . If Byte High Enable ($\overline{BHE}$) is LOW, then data from memory will appear on I/O_8 to I/O_{15} . See the truth table at the back of this data sheet for a complete description of read and write modes.

Note:

1. For best practice recommendations, please refer to the Cypress application note *System Design Guidelines* on <http://www.cypress.com>.

Pin Configuration^[2, 3]

Notes:

2. NC pins are not connected to the die.
3. DNU pins are to be connected to V_{SS} or left open.

- $\overline{BHE} \cdot \overline{BLE}$ is the AND of both $\overline{BHE}$ and $\overline{BLE}$. Chip can be deselected by either disabling the chip enable signals or by disabling both $\overline{BHE}$ and $\overline{BLE}$.

Switching Waveforms
Read Cycle No. 1 (Address Transition Controlled)^[14, 15]

Notes:

- Test conditions assume signal transition time of 3 ns or less, timing reference levels of $V_{CC(typ.)}/2$, input pulse levels of 0 to $V_{CC(typ.)}$, and output loading of the specified I_{OL} .
- At any given temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} .
- If both byte enables are toggled together, this value is 10 ns.
- t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high-impedance state.
- The internal Write time of the memory is defined by the overlap of $\overline{WE}$, $\overline{CE_1} = V_{IL}$, $\overline{BHE}$ and/or $\overline{BLE} = V_{IL}$.
- Device is continuously selected. $\overline{OE}$, $\overline{CE_1} = V_{IL}$, $\overline{BHE}$ and/or $\overline{BLE} = V_{IL}$, $\overline{CE_2} = V_{IH}$.
- $\overline{WE}$ is HIGH for Read cycle.

Switching Waveforms (continued)
Read Cycle No. 2 ($\overline{OE}$ Controlled)^[15, 16]

Write Cycle No. 1 ($\overline{WE}$ Controlled)^[13, 17, 18, 19]

Notes:

16. Address valid prior to or coincident with $\overline{CE_1}$, $\overline{BHE}$, $\overline{BLE}$ transition LOW and CE_2 transition HIGH.
17. Data I/O is high-impedance if $OE = V_{IH}$.
18. If CE_1 goes HIGH or CE_2 goes LOW simultaneously with $\overline{WE}$ HIGH, the output remains in a high-impedance state.
19. During the DON'T CARE period in the DATA I/O waveform, the I/Os are in output state and input signals should not be applied.
