262144-BIT(32768-WORD BY 8-BIT)CMOS STATIC RAM

DESCRIPTION

This M5M5256CP, FP, KP, VP, RV is a 262144-bit CMOS static RAMs organized as 32768-words by 8-bits which is fabricated using high-performance 3 polysilicon CMOS technology. The use of resistive load NMOS cells and CMOS periphery result in a high-density and low-power static RAM. Stand-by current is small enough for battery back-up applicaton. It is ideal for the memory systems which require simple interface.

Especially the M5M5256CVP, RV are packaged in a 28-pin thin small outline package. Two types of devices are available, M5M5256CVP (normal lead bend type package) and M5M5256CRV (reverse lead bend type package). Using both type of devices, it becomes very easy to design a printed circuit board.

FEATURES

Type name	Access time (max)	Power supply current	
		Active (max)	Stand-by (max)
M5M5256CP, FP, KP, VP, RV-85LL	85ns	50mA (Vcc=5.5V)	20 μA (Vcc = 5.5V)
M5M5256CP, FP, KP, VP, RV-10LL	100ns		
M5M5256CP, FP, KP, VP, RV-85XL	85ns		5 μA (Vcc = 5.5V) 0.05 μA (Vcc = 3V, typ)
M5M5256CP, FP, KP, VP, RV-10XL	100ns		

- Single +5V power supply
- No clocks, no refresh
- Data-hold on +2V power supply
- Directly TTL compatible : All inputs and outputs
- Three-state outputs : OR-tie capability
- Simple memory expansion by $\overline{S}$
- $\overline{OE}$ prevents data contention in the I/O bus
- Common data I/O
- Low stand-by current ····· 0.05 μA (typ)
- Package
  - M5M5256CP ····· 28 pin 600 mil DIP
  - M5M5256CKP ····· 28 pin 300 mil DIP
  - M5M5256CFP ····· 28 pin 450 mil SOP
  - M5M5256CVP, RV ····· 28pin 8 × 13.4mm² TSOP

FUNCTION

The operation mode of the M5M5256CP, FP, KP, VP, RV is determined by a combination of the device control inputs $\overline{S}$, $\overline{W}$ and $\overline{OE}$. Each mode is summariezed in the function table.

A write cycle is executed whenever the low level $\overline{W}$ overlaps with the low level $\overline{S}$. The address must be set-up before the write cycle and must be stable during the entire cycle. The data is latched into a cell on the trailing edge of $\overline{W}$, $\overline{S}$, whichever occurs first, requiring the set-up and hold time relative to these edge to be maintained. The output enable $\overline{OE}$ directly controls the output stage. Setting the $\overline{OE}$ at a high level, the output stage is in a high-impedance state, and the data bus contention problem in the write cycle is eliminated.

A read cycle is executed by setting $\overline{W}$ at a high level and $\overline{OE}$ at a low level while $\overline{S}$ are in an active state.

When setting $\overline{S}$ at a high level, the chip is in a non-selectable mode in which both reading and writing are disabled. In this mode, the output stage is in a high-impedance state, allowing OR-tie with other chips and memory expansion by $\overline{S}$. The power supply current is reduced as low as the stand-by current which is specified as I_{CC3} or I_{CC4}, and the memory data can be held +2V power supply, enabling battery back-up operation during power failure or power-down operation in the non-selected mode.
