## 8-bit Proprietary Microcontroller

## CMOS

## F²MC-8L MB89140 Series

## MB89145/146 and MB89P147/PV140

## ■ DESCRIPTION

The MB89140 series is a line of single-chip microcontrollers that use the $\mathrm{F}^{2} \mathrm{MC}^{\star}-8 \mathrm{~L}$ CPU core which can operate at low voltage but at high speed. The MB89140 series contains a variety of peripheral functions, such as timers, a serial interface, an A/D converter, and an external interrupt. The MB89140 series is applicable to a wide range of applications from welfare products to industrial equipment, including portable devices.
*: F²MC stands for FUJITSU Flexible Microcontroller.
■ FEATURES

- Minimum execution time: $0.5 \mu \mathrm{~s} / 8-\mathrm{MHz}$ oscillation
- $\mathrm{F}^{2} \mathrm{MC}-8 \mathrm{~L}$ family CPU core

Instruction set optimized for controllers
Multiplication and division instructions
16-bit arithmetic operations
Test and branch instructions
Bit manipulation instructions, etc.
(Continued)

## PACKAGE

| 64-pin Plastic SH-DIP |  |  |
| :--- | :--- | :--- |
| 64-pin Plastic QFP | 64-pin Ceramic MDIP | 64-pin Ceramic MQFP |
| (DIP-64P-M01) | (MPT-64P-M06) |  |

## MB89140 Series

(Continued)

- Low-voltage operation (when an A/D converter is not used)
- Low current consumption (compatible with dual-clock system)
- High-voltage ports on chip
- Five types of timers

8 -bit PWM timer (also usable as a reload timer)
12-bit MPG timer (also usable as a PPG output, PWM output, and reload timer)
8/16-bit timer (also usable as two 8-bit timers)
21-bit time-base timer

- One serial interface

Swichable transfer direction allows communication with various equipment.

- 10-bit A/D converter: 12 channels Successive approximation type
- External interrupt: 2 channels

Two channels are independent and capable of wake-up from low-power consumption modes. (Rising edge, falling edge/both edges selectability)
-0.3 V to +7.0 V can be applied to INT 1 ( N -ch open-drain)

- Low-power consumption modes

Stop mode (Oscillation stops to minimize the current consumption.)
Sleep mode (The CPU stops to reduce the current consumption to approx. $1 / 3$ of normal.)
Subclock mode
Watch mode

- Reset output and power-on reset selectability

## PRODUCT LINEUP

| Part number <br> Parameter | MB89145 | MB89146 | MB89P147 | MB89PV140 |
| :---: | :---: | :---: | :---: | :---: |
| Classification | Mass production products (mask ROM products) |  | One-time PROM/ EPROM product | Piggyback/ evaluation product (for evaluation and development) |
| ROM size | $16 \mathrm{~K} \times 8$ bits (internal mask ROM) | $24 \mathrm{~K} \times 8$ bits (internal mask ROM) | $\begin{gathered} 32 \mathrm{~K} \times 8 \text { bits } \\ \text { (internal PROM) } \end{gathered}$ | $32 \mathrm{~K} \times 8$ bits (external ROM) |
| RAM size | $512 \times 8$ bits | $768 \times 8$ bits | $1 \mathrm{~K} \times 8$ bits |  |
| CPU functions | Number of instructions: 136 <br> Instruction bit length: 8 bits <br> Instruction length: 1 to 3 bytes <br> Data bit length: $1,8,16$ bits <br> Minimum execution time: $0.5 \mu \mathrm{~s} / 8 \mathrm{MHz}$ to $8.0 \mu \mathrm{~s} / 8 \mathrm{MHz}, 61 \mu \mathrm{~s} / 32.768 \mathrm{kHz}$ <br> Interrupt processing time: $4.5 \mu \mathrm{~s} / 8 \mathrm{MHz}$ to $72.0 \mu \mathrm{~s} / 8 \mathrm{MHz}, 562.5 \mu \mathrm{~s} / 32.768 \mathrm{kHz}$ <br> Note: The above times change according to the gear function. |  |  |  |
| Ports | High-voltage output port <br> (P-ch open-drain): 8 (P60 to P67, for heavy current) 16 (P40 to P47, P50 to <br>  <br> Buzzer output <br> P57 for low current)  <br> (P-ch open-drain, high-voltage):  <br> Output ports (CMOS): 4 (P20 to P23) <br> Input ports (CMOS): 2 (P70 and P71, function as X0A and XIA pins when <br>  dual-clock system is used.) <br> I/O ports (CMOS): 23 (P00 to P07, P10 to P17, P30, and P32 to P37) <br> I/O ports (N-ch open-drain): 1 (P31) <br> Total: 55 |  |  |  |
| Clock timer | 21 bits $\times 1$ (in main clock mode), 15 bits $\times 1$ (at 32.768 kHz ) |  |  |  |
| 8-bit PWM timer (timer 1) | 8-bit timer operation <br> (toggled output capable, operating clock: 1, 2, 8, 16 system clock cycles) 8-bit resolution PWM operation (conversion cycle: $128 \mu \mathrm{~s}$ to 2.0 ms at $8.0-\mathrm{MHz}$ oscillation, and highest gear speed) |  |  |  |
| $\begin{aligned} & \text { 12-bit MPG } \\ & \text { (timer 4) } \end{aligned}$ | 12-bit resolution PWM operation (maximum conversion cycle of $2048.4 \mu \mathrm{~s}$ to 16.4 ms at 8.0 MHz-oscillation, and highest gear speed) <br> 12-bit resolution reload timer operation (toggled output capable) <br> 12-bit resolution PPG operation (minimum resolution of $0.5 \mu \mathrm{~s}$ at $8.0-\mathrm{MHz}$ oscillation, and highest gear speed) |  |  |  |
| 8/16-bit timer counter (timer 2, 3) | 8/16-bit timer operation (operating clock, internal clock, external trigger) 8/16-bit event counter operation (Rising edge/falling edge/both edges selectability) |  |  |  |

## MB89140 Series

## ■ DIFFERENCES AMONG PRODUCTS

## 1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used. Take particular care on the following points:

- On the MB89P147, the program area starts from address 8007н but on the MB89PV140 starts from 8000н.
(On the MB89P147, addresses 8000 н to 8006 н comprise the option setting area, option settings can be read by reading these addresses. On the MB89PV140, addresses 8000 н to 8006 н could also be used as a program ROM. However, do not use these addresses in order to maintain compatibility of the MB89P147.)
- The stack area, etc., is set at the upper limit of the RAM.

## 2. Current Consumption

- In the case of the MB89PV140, add the current consumed by the EPROM which is connected to the top socket.
- When operated at low speed, the product with an OTPROM (one-time PROM) or an EPROM will consume more current than the product with a mask ROM.
However, the current consumption in sleep/stop modes is the same. (For more information, see section " $\quad$ Electrical Characteristics.")

## 3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product. Before using options check section "■ Mask Options."
Take particular care on the following points:

- Options are fixed on the MB89PV140.
- On the MB89P147, MB89145, and MB89146, the pull-down resistor option can either be selected for all affected pins, or for no pin; it is not possible to specify the pull-down resistor option for individual pins.

## 4. Subclock Oscillation Feedback Resistor

A built-in oscillation feedback resistor is provided for the subclock oscillator pin on the MB89PV140, but it is not provided for the MB89145, MB89146, MB89P147. Therefor these products should be connected to an external oscillation feedback resistor.

## MB89140 Series

## PIN ASSIGNMENT

*: When dual-clock system is selected.

- Pin assignment on package top (MB89PV140 only)

| Pin no. | Pin name | Pin no. | Pin name | Pin no. | Pin name | Pin no. | Pin name |

## MB89140 Series

## HANDLING DEVICES

## 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than $\mathrm{V}_{\text {cc }}$ or lower than $\mathrm{V}_{\text {ss }}$ is applied to input and output pins other than medium- to high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in section "■ Electrical Characteristics" is applied between $\mathrm{V}_{\mathrm{cc}}$ and V ss. (However, up to 7.0 V can be applied to P31/INT pin, regardless of V cc)

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

## 2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

## 3. Treatment of N.C. Pins

Be sure to leave (internally connected) N.C. pins open.

## 4. Power Supply Voltage Fluctuations

Although $V_{c c}$ power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that $\mathrm{V}_{\mathrm{cc}}$ ripple fluctuations (P-P value) will be less than $10 \%$ of the standard $V_{c c}$ value at the commercial frequency ( 50 to 60 Hz ) and the transient fluctuation rate will be less than $0.1 \mathrm{~V} / \mathrm{ms}$ at the time of a momentary fluctuation such as when power is switched.

## 5. Precautions when Using an External Clock

Even when an external clock is used, oscillation stabilization time is required for power-on reset (optional) and wake-up from stop mode.

## MB89140 Series

## PROGRAMMING TO THE EPROM ON THE MB89P147

The MB89P147 is an OTPROM version of the MB89140 series.

## 1. Features

- 32-Kbyte PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C256A in EPROM mode (when programmed with the EPROM programmer)

## 2. Memory Space

Memory space in each mode such as 32-Kbyte PROM, option area is diagrammed below.

## 3. Programming to the EPROM

In EPROM mode, the MB89P147 functions equivalent to the MBM27C256A. This allows the PROM to be programmed with a general-purpose EPROM programmer (the electronic signature mode cannot be used) by using the dedicated socket adapter.

When the operating ROM area for a single chip is 32 Kbytes (8007н to FFFFH) the PROM can be programmed as follows:

## - Programming procedure

(1) Set the EPROM programmer to the MBM27C256A.
(2) Load program data into the EPROM programmer at 0007н to 7FFFH (note that addresses 8007н to FFFFH while operating as a single chip assign to 0007н to 7FFF in EPROM mode).
Load option data into addresses 0000н to 0006н of the EPROM programmer. (For information about each corresponding option, see " 5 . Setting OTPROM Options." in section "■ Programming to the EPROM with Piggyback/evaluation Device" )
(3) Program to 0000 to 7 7FFFr with the EPROM programmer.

## MB89140 Series

## 4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.

## 5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of $100 \%$ cannot be assured at all times.

## 6. EPROM Programmer Socket Adapter

| Package | Compatible socket adapter |
| :---: | :--- |
| DIP-64P-M01 | ROM-64SD-28DP-8L4 |
| FPT-64P-M06 | ROM-64QF-28DP-8L4 |

Inquiry: Sun Hayato Co., Ltd.: TEL 81-3-3802-5760

## PROGRAMMING TO THE EPROM WITH PIGGYBACK/EVALUATION DEVICE

1. EPROM for Use

MBM27C256A-20TV, MBM27C256A-20CZ

## 2. Programming Socket Adapter

To program to the PROM using an EPROM programmer, use the socket adapter (manufacturer: Sun Hayato Co., Ltd.) listed below.

## 3. Memory Space

Memory space in each mode, such as 32 -Kbyte PROM, option area is diagrammed below.

## 4. Programming to the EPROM

(1) Set the EPROM programmer to the MBM27C256A.
(2) Load program data into the EPROM programmer at 0007н to 7FFFн.
(3) Program to 0000 to 7 7FFFн with the EPROM programmer.

## MB89140 Series

## 5. Setting OTPROM Options

The programming procedure is the same as that for the PROM. Options can be set by programming values at the addresses shown on the memory map. The relationship between bits and options is shown on the following bit map:

- OTPROM option bit map

|  | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 |

| $\begin{gathered} 8006 \mathrm{H} \\ (0006 \mathrm{H}) \end{gathered}$ | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable | Vacancy <br> Readable and writable |

Notes: - Set each bit to 1 to erase.

- Do not write 0 to the vacant bit.

The read value of the vacant bit is 1 , unless 0 is written to it.

- The parenthesized addresses are the corresponding addresses on the EPROM programmer.

## MB89140 Series

## BLOCK DIAGRAM

## MB89140 Series

## CPU CORE

## 1. Memory Space

The microcontrollers of the MB89140 series offer a memory space of 64 Kbytes for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89140 series is structured as illustrated below.

## Memory Space

[^0]
## MB89140 Series

## 2. Registers

The F²MC-8L family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

Program counter (PC): A 16-bit register for indicating instruction storage positions
Accumulator (A): A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8 -bit data processing instruction, the lower byte is used.

Temporary accumulator (T): A 16-bit register which performs arithmetic operations with the accumulator When the instruction is an 8-bit data processing instruction, the lower byte is used.

Index register (IX): A 16-bit register for index modification
Extra pointer (EP):
Stack pointer (SP):
A 16-bit pointer for indicating a memory address
A 16-bit register for indicating a stack area
Program status (PS): A 16-bit register for storing a register pointer, a condition code

The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

## Structure of the Program Status Register

## MB89140 Series

The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

## Rule for Conversion of Actual Addresses of the General-purpose Register Area

The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

H-flag: Set when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared otherwise. This flag is for decimal adjustment instructions.

I-flag: Interrupt is allowed when this flag is set to 1 . Interrupt is prohibited when the flag is set to 0 . Set to 0 when reset.

IL1, 0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

| IL1 | ILO | Interrupt level | High-low |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 1 | High |
| 0 | 1 |  |  |
| 1 | 0 | 2 |  |
| 1 | 1 | 3 |  |

N -flag: Set if the MSB is set to 1 as the result of an arithmetic operation. Cleared when the bit is set to 0 .
Z-flag: Set when an arithmetic operation results in 0 . Cleared otherwise.
V-flag: Set if the complement on 2 overflows as a result of an arithmetic operation. Reset if the overflow does not occur.

C-flag: Set when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared otherwise. Set to the shift-out value in the case of a shift instruction.

## MB89140 Series

The following general-purpose registers are provided:
General-purpose registers: An 8-bit register for storing data
The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers and up to a total of 32 banks can be used in the MB89140 series. The bank currently in use is indicated by the register bank pointer (RP).

## Register Bank Configuration

This address $=0100 \mathrm{H}+8 \times(\mathrm{RP})$

## ELECTRICAL CHARACTERISTICS

## 1. Absolute Maximum Ratings

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| Power supply voltage | Vcc | $\mathrm{V}_{\text {ss }}-0.3$ | $\mathrm{V}_{\text {ss }+7.0}$ | V |  |
|  | AV ${ }_{\text {cc }}$ | $\mathrm{V}_{\text {ss }}-0.3$ | $\mathrm{V}_{\text {ss }}+7.0$ | V | ${ }^{2}$ |
| I/O voltage | V101 | $\mathrm{V}_{\text {ss }}-0.3$ | $\mathrm{V}_{\mathrm{cc}}+0.3$ | V | Except P31 |
|  | V102 | $\mathrm{V}_{\text {ss }}-0.3$ | 7 | V | P31 |
| " H " level total average output current | Iloh | - | -120 | mA | Average value (operating current $\times$ operating rate) |
| " H " level maximum output current | Іон | - | -12 | mA | P00 to P07, P10 to P17, <br> P20 to P23, P30, P32 to P37 |
|  |  | - | -20 | mA | P40 to P47, P50 to P57 |
|  |  | - | -36 | mA | P60 to P67, BZ |
| " H " level average output current | lohav | - | -6 | mA | P00 to P07, P10 to P17, P20 to P23, P30, P32 to P37 Average value (operating current $\times$ operating rate) |
|  |  | - | -10 | mA | P40 to P47, P50 to P57 Average value (operating current $\times$ operating rate) |
|  |  | - | -18 | mA | P60 to P67, BZ Average value (operating current $\times$ operating rate) |
| "L" level total average output current | Elolav | - | 150 | mA | Average value (operating current $\times$ operating rate) |
| "L" level maximum output current | lob | - | 12 | mA | $\begin{aligned} & \text { P00 to P07, P10 to P17, } \\ & \text { P20 to P23, P30 to P37 } \end{aligned}$ |
| "L" level average output current | lolav | - | 6 | mA | $\begin{aligned} & \text { P00 to P07, P10 to P17, } \\ & \text { P20 to P23, P30 to P37 } \\ & \text { Average value (operating current } \times \\ & \text { operating rate) } \end{aligned}$ |
| Power consumption | PD | - | 500 | mW |  |
| Operating temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |
| Storage temperature | Tstg | -55 | +150 | ${ }^{\circ} \mathrm{C}$ |  |

*1: The total average output current is defined as the average current that flows through all of the relevant pins in a 100 ms period. The output peak current is defined as the peak value of any one of the relevant pins. The average output current is defined as the average current that flows through any one of the relevant pins in a 100 ms period.
*2: Use $A V c c$ and $V_{c c}$ set at the same voltage.
Take care so that AV cc does not exceed Vcc , such as when power is turned on.
Precautions: Permanent device damage may occur if the above "Absolute Maximum Ratings" are exceeded. Functional operation should be restricted to the conditions as detailed in the operational sections of this data sheet. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## 2. Recommended Operating Conditions

$\left(\mathrm{AV} \mathrm{ss}=\mathrm{V}_{\mathrm{ss}}=0.0 \mathrm{~V}\right)$

| Parameter | Symbol | Value |  | Unit | Remarks |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Max. |  |  |
| Power supply voltage | Vcc AVcc | 2.7* | 6.0* | V | Normal operation assurance range* |
|  |  | 2.2 | 6.0 | V | In watch mode or subclock operation (Only for the MB89P147, the minimum value is 2.7 V .) |
|  |  | 1.5 | 6.0 | V | Retains the RAM state in stop mode |
|  | VFDP | Vcc - 40 | $\mathrm{Vcc}+0.3$ | V |  |
| Operating temperature | $\mathrm{T}_{\mathrm{A}}$ | -40 | +85 | ${ }^{\circ} \mathrm{C}$ |  |

*: These values vary with the operating frequency and analog assurance range. See Figure 1 and " 5 . A/D Converter Electrical Characteristics."

Figure 1 Operating Voltage vs. Main Clock Operating Frequency
Figure 1 indicates the operating frequency of the external oscillator at an instruction cycle of $4 / \mathrm{Fch}$.
Since the operating voltage range is dependent on the instruction cycle, see minimum execution time if the operating speed is switched using a gear.

|  |  |  | Min. | Max. |  |  |
| Power supply rising time | tR | - | - | 50 | ms | Power-on reset function only |
| Power supply cut-off time | toff |  | 1 | - | ms | Due to repeated operations |

Note: Make sure that power supply rises within the selected oscillation stabilization time.
If power supply voltage needs to be varied in the course of operation, a smooth voltage rise is recommended.

| Zero transition voltage | Vот | ANO to ANB | - | AVss-1.5 LSB | AVss + 0.5 LSB | AVss + 2.5 LSB | mV |  |
| Full-scale transition voltage | $V_{\text {fst }}$ | ANO to ANB | - | AV ${ }_{\text {cc }}-3.5$ LSB | AV ${ }_{\text {cc }}-1.5$ LSB | AVcc +0.5 LSB | mV |  |
| Interchannel disparity | - | - | - | - | - | 4 | LSB |  |
| A/D mode conversion time |  |  | At $8-\mathrm{MHz}$ oscillation | 33 | - | - | tinst |  |
| Analog port input current | Iain | ANO to ANB | $\begin{aligned} & \mathrm{AV} \mathrm{Vc}=\mathrm{V}_{\mathrm{cc}} \\ & =5.0 \mathrm{~V} \end{aligned}$ | - | - | 10 | $\mu \mathrm{A}$ |  |
| Analog input voltage | - | ANO to ANB | - | 0.0 | - | AVcc | V |  |

*: For information on tinst, see "(4) Instruction Cycle" in "4. AC Characteristics."
Notes: - The smaller AV cc , the greater the error would become relatively.

- The output impedance of the external circuit connected to an analog input block should be no more than several $k \Omega$. If the output impedance is too high, the analog voltage sampling time might be insufficient.

## MB89140 Series

## (1) A/D Glossary

- Resolution

Analog changes that are identifiable with the A/D converter

- Linearity error

The deviation of the straight line connecting the zero transition point ("00 00000000 " $\leftrightarrow$ "00 00000001 ") with the full-scale transition point ("1111111110" $\leftrightarrow$ "11 11111111") from actual conversion characteristics

- Differential linearity error

The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

- Total error

The difference between theoretical and actual values
This error is caused by the zero transition error, full-scale transition error, linearity error, quantization error and noise.

## INSTRUCTIONS

Execution instructions can be divided into the following four groups:

- Transfer
- Arithmetic operation
- Branch
- Others

Table 1 lists symbols used for notation of instructions.
Table 1 Instruction Symbols

| Symbol | Meaning |
| :---: | :--- |
| dir | Direct address (8 bits) |
| off | Offset (8 bits) |
| ext | Extended address (16 bits) |
| \#vct | Vector table number (3 bits) |
| \#d8 | Immediate data (8 bits) |
| \#d16 | Immediate data (16 bits) |
| dir: b | Bit direct address (8:3 bits) |
| rel | Branch relative address (8 bits) |
| @ | Register indirect (Example: @A, @IX, @EP) |
| A | Accumulator A (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| AH | Upper 8 bits of accumulator A (8 bits) |
| AL | Lower 8 bits of accumulator A (8 bits) |
| T | Temporary accumulator T (Whether its length is 8 or 16 bits is determined by the <br> instruction in use.) |
| TH | Upper 8 bits of temporary accumulator T (8 bits) |
| TL | Lower 8 bits of temporary accumulator T (8 bits) |
| IX | Index register IX (16 bits) |

(Continued)

## MB89140 Series

(Continued)

| Symbol |  |
| :---: | :--- |
| EP | Extra pointer EP (16 bits) |
| PC | Program counter PC (16 bits) |
| SP | Stack pointer SP (16 bits) |
| PS | Program status PS (16 bits) |
| dr | Accumulator A or index register IX (16 bits) |
| CCR | Condition code register CCR (8 bits) |
| RP | Register bank pointer RP (5 bits) |
| Ri | General-purpose register Ri (8 bits, $\mathrm{i}=0$ to 7 ) |
| $\times$ | Indicates that the very $\times$ is the immediate data. <br> (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| $(\times)$ | Indicates that the contents of $\times$ is the target of accessing. <br> (Whether its length is 8 or 16 bits is determined by the instruction in use.) |
| $((\times))$ | The address indicated by the contents of $\times$ is the target of accessing. <br> (Whether its length is 8 or 16 bits is determined by the instruction in use.) |

Columns indicate the following:

| Mnemonic: | Assembler notation of an instruction |
| :--- | :--- |
| $\sim:$ | Number of instructions |
| \#: | Number of bytes |
| Operation: | Operation of an instruction |

TL, TH, AH: A content change when each of the TL, TH, and AH instructions is executed. Symbols in the column indicate the following:

- "-" indicates no change.
- dH is the 8 upper bits of operation description data.
- AL and AH must become the contents of AL and AH immediately before the instruction is executed.
- 00 becomes 00 .
$\mathrm{N}, \mathrm{Z}, \mathrm{V}, \mathrm{C}: \quad$ An instruction of which the corresponding flag will change. If + is written in this column, the relevant instruction will change its corresponding flag.
OP code: $\quad$ Code of an instruction. If an instruction is more than one code, it is written according to the following rule:
Example: 48 to $4 \mathrm{~F} \leftarrow$ This indicates $48,49, \ldots 4 \mathrm{~F}$.

## MB89140 Series
