TIMING WAVEFORMS

READ CYCLE 1 (Address Controlled) (1,2,4)

READ CYCLE 2 (CE#, OE# Controlled) (1,3,5,6)

Notes :

1. WE# is HIGH for read cycle.
2. Device is continuously selected CE#=V_{IL} and UB#=V_{IH} and ,LB#= V_{IL}
3. Address must be valid prior to or coincident with CE# and (UB# and, or LB#) transition now.
4. OE# = V_{IL}.
5. tCLZ , tOLZ, tCHZ, and tOHZ are specified with C_L=5pF. Transition is measured $\pm$ 500mV from steady state.
6. At any given temperature and voltage condition, tCHZ is less than tCLZ , tOHZ is less than tOLZ.

WRITE CYCLE 1 (WE# Controlled) (1,2,3,5)

WRITE CYCLE 2 (CE#) (1,2,5)

Notes :

1. WE# or CE# must be HIGH during all address transitions.
2. A write occurs during the overlap of a low CE# and a low WE#.
3. During a WE# controlled with write cycle with OE# LOW, t_{WP} must be greater than $t_{WHZ} + t_{DW}$ to allow the I/O drivers to turn off and data to be placed on the bus.
4. During this period, I/O pins are in the output state, and input signals must not be applied.
5. If the CE# LOW transition occurs simultaneously with or after WE# LOW transition, the outputs remain in a high impedance state.
6. t_{OW} and t_{WHZ} are specified with $C_L = 5\text{pF}$. Transition is measured $\pm 500\text{mV}$ from steady state.
