

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

- **Excellent-Price/Performance Floating-Point Digital Signal Processors (DSPs):**  
TMS320C67x™ (C6711, C6711B, C6711C, and C6711D)
  - Eight 32-Bit Instructions/Cycle
  - 100-, 150-, 167-, 200-, 250-MHz Clock Rates
  - 10-, 6.7-, 6-, 5-, 4-ns Instruction Cycle Time
  - 600, 900, 1000, 1200, 1500 MFLOPS
- **Advanced Very Long Instruction Word (VLIW) C67x™ DSP Core**
  - Eight Highly Independent Functional Units:
    - Four ALUs (Floating- and Fixed-Point)
    - Two ALUs (Fixed-Point)
    - Two Multipliers (Floating- and Fixed-Point)
  - Load-Store Architecture With 32 32-Bit General-Purpose Registers
  - Instruction Packing Reduces Code Size
  - All Instructions Conditional
- **Instruction Set Features**
  - Hardware Support for IEEE Single-Precision and Double-Precision Instructions
  - Byte-Addressable (8-, 16-, 32-Bit Data)
  - 8-Bit Overflow Protection
  - Saturation
  - Bit-Field Extract, Set, Clear
  - Bit-Counting
  - Normalization
- **L1/L2 Memory Architecture**
  - 32K-Bit (4K-Byte) L1P Program Cache (Direct Mapped)
  - 32K-Bit (4K-Byte) L1D Data Cache (2-Way Set-Associative)
  - 512K-Bit (64K-Byte) L2 Unified Mapped RAM/Cache (Flexible Data/Program Allocation)
- **Device Configuration**
  - Boot Mode: HPI, 8-, 16-, 32-Bit ROM Boot
  - Endianness: Little Endian, Big Endian
- **Enhanced Direct-Memory-Access (EDMA) Controller (16 Independent Channels)**
- **32-Bit External Memory Interface (EMIF)**
  - Glueless Interface to Asynchronous Memories: SRAM and EPROM
  - Glueless Interface to Synchronous Memories: SDRAM and SBSRAM
  - 256M-Byte Total Addressable External Memory Space
- **16-Bit Host-Port Interface (HPI)**
- **Two Multichannel Buffered Serial Ports (McBSPs)**
  - Direct Interface to T1/E1, MVIP, SCSA Framers
  - ST-Bus-Switching Compatible
  - Up to 256 Channels Each
  - AC97-Compatible
  - Serial-Peripheral-Interface (SPI) Compatible (Motorola™)
- **Two 32-Bit General-Purpose Timers**
- **Flexible Phase-Locked-Loop (PLL) Clock Generator [C6711/11B]**
- **Flexible Software Configurable PLL-Based Clock Generator Module [C6711C/11D]**
- **A Dedicated General-Purpose Input/Output (GPIO) Module With 5 Pins [C6711C/11D]**
- **IEEE-1149.1 (JTAG<sup>†</sup>) Boundary-Scan-Compatible**
- **256-Pin Ball Grid Array (BGA) Package (GFN Suffix) [C6711/C6711B Only]**
- **272-Pin Ball Grid Array (BGA) Package (GDP Suffix) [C6711C/C6711D Only]**
- **CMOS Technology**
  - 0.13-μm/6-Level Copper Metal Process (C6711C/C6711D)
  - 0.18-μm/5-Level Copper Metal Process (C6711/11B)
- **3.3-V I/O, 1.4-V Internal (C6711D–250)**
- **3.3-V I/O, 1.20-V Internal (C6711C/C6711D)<sup>‡</sup>**
- **3.3-V I/O, 1.8-V Internal (C6711B/C6711–100)**
- **3.3-V I/O, 1.9-V Internal (C6711-150)**

## description

The TMS320C67x™ DSPs (including the TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D devices<sup>†</sup>) compose the floating-point DSP family in the TMS320C6000™ DSP platform. The C6711, C6711B, C6711C, and C6711D devices are based on the high-performance, advanced very-long-instruction-word (VLIW) architecture developed by Texas Instruments (TI), making these DSPs an excellent choice for multichannel and multifunction applications.

With performance of up to 900 million floating-point operations per second (MFLOPS) at a clock rate of 150 MHz, the C6711/C6711B device offers cost-effective solutions to high-performance DSP programming challenges. The C6711/C6711B DSP possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide four floating-/fixed-point ALUs, two fixed-point ALUs, and two floating-/fixed-point multipliers. The C6711/C6711B can produce two MACs per cycle for a total of 300 MMACS.

With performance of up to 1200 million floating-point operations per second (MFLOPS) at a clock rate of 200 MHz or 1350 MFLOPS at a clock rate of 250 MHz (for 6711D), the C6711C/C6711D device also offers cost-effective solutions to high-performance DSP programming challenges. The C6711C/C6711D DSP also possesses the operational flexibility of high-speed controllers and the numerical capability of array processors. This processor has 32 general-purpose registers of 32-bit word length and eight highly independent functional units. The eight functional units provide four floating-/fixed-point ALUs, two fixed-point ALUs, and two floating-/fixed-point multipliers. The C6711C/C6711D can produce two MACs per cycle for a total of 400 MMACS.

The C6711/C6711B/C6711C/C6711D DSPs also have application-specific hardware logic, on-chip memory, and additional on-chip peripherals.

The C6711/C6711B/C6711C/C6711D uses a two-level cache-based architecture and has a powerful and diverse set of peripherals. The Level 1 program cache (L1P) is a 32-Kbit direct mapped cache and the Level 1 data cache (L1D) is a 32-Kbit 2-way set-associative cache. The Level 2 memory/cache (L2) consists of a 512-Kbit memory space that is shared between program and data space. L2 memory can be configured as mapped memory, cache, or combinations of the two. The peripheral set includes two multichannel buffered serial ports (McBSPs), two general-purpose timers, a host-port interface (HPI), and a glueless external memory interface (EMIF) capable of interfacing to SDRAM, SBSRAM and asynchronous peripherals.

The C6711/C6711B/C6711C/C6711D has a complete set of development tools which includes: a new C compiler, an assembly optimizer to simplify programming and scheduling, and a Windows™ debugger interface for visibility into source code execution.

TMS320C6000 is a trademark of Texas Instruments.

Windows is a registered trademark of the Microsoft Corporation.

<sup>†</sup> Throughout the remainder of this document, the TMS320C6711, TMS320C6711B, TMS320C6711C, and TMS320C6711D shall be referred to as TMS320C67x or C67x where generic, and where specific, their individual full device part numbers will be used or abbreviated as C6711, C6711B, C6711C, C6711D, 11, 11B, 11C, or 11D, etc.

## device characteristics

Table 1 provides an overview of the C6711/C6711B/C6711C/C6711D DSPs. The table shows significant features of each device, including the capacity of on-chip RAM, the peripherals, the execution time, and the package type with pin count. For more details on the C6000™ DSP device part numbers and part numbering, see Table 18 and Figure 5.

**Table 1. Characteristics of the C6711/C6711B and C6711C/C6711D Processors**

| HARDWARE FEATURES                                                                          |                                       | INTERNAL CLOCK SOURCE | C6711/C6711B<br>(FLOATING-POINT DSPs)                                                                              | C6711C/C6711D<br>(FLOATING-POINT DSPs)                                                                            |

## device compatibility

The TMS320C6211/C6211B and C6711/C6711B devices are pin-compatible and have the same peripheral set; thus, making new system designs easier and providing faster time to market. The following list summarizes the device characteristic differences among the C6211, C6211B, C6711, C6711B, C6711C, and C6711D devices:

- The C6211 and C6211B devices have a fixed-point C62x CPU, while the C6711, C6711B, C6711C, and C6711D devices have a floating-point C67x CPU.
- The C6211/C6211B device runs at -167 and -150 MHz clock speeds (with a C6211BGFNA extended temperature device that also runs at -150 MHz), while the C6711/C6711B device runs at -150 and -100 MHz (with a C6711BGFNA extended temperature device that also runs at -100 MHz) and the C6711C/C6711D device runs at -200 clock speed (with a C6711CGDPA and C6711DGDPA extended temperature devices that also run at -167 MHz).
- The C6211/C6211B, C6711-100, and C6711B devices have a core voltage of 1.8 V, the C6711-150 device core voltage is 1.9 V, and the C6711C and C6711D devices operate with a core voltage of 1.20<sup>†</sup> V.
- There are several enhancements and features that are only available on the C6711C/C6711D device, such as: the CLKOUT3 signal, a software programmable PLL and PLL Controller, and a GPIO peripheral module. The C6711D device also has additional enhancements such as: EMIF Big Endian mode correctness EMIFBE and the L1D requestor priority to L2 bit ["P" bit] in the cache configuration (CCFG) register.

For more detailed discussion on the migration of a C6211, C6211B, C6711, C6711B device to a TMS320C6711C device, see the *Migrating from TMS320C6211B/6711B to TMS320C6711C* application report (literature number SPRA837).

For a more detailed discussion on the similarities/differences between the C6211 and C6711 devices, see the *How to Begin Development Today with the TMS320C6211 DSP* and *How to Begin Development with the TMS320C6711 DSP* application reports (literature number SPRA474 and SPRA522, respectively).

## functional block and CPU (DSP core) diagram

† In addition to fixed-point instructions, these functional units execute floating-point instructions.

‡ The C6711C/C6711D device has a software-configurable PLL (with x4 through x25 multiplier and /1 through /32 divider) and a PLL Controller which is different from the hardware PLL peripheral on the C6711 and C6711B devices.

§ Applicable to the C6711C/C6711D device only

## CPU (DSP core) description

The CPU fetches advanced very-long instruction words (VLIW) (256 bits wide) to supply up to eight 32-bit instructions to the eight functional units during every clock cycle. The VLIW architecture features controls by which all eight units do not have to be supplied with instructions if they are not ready to execute. The first bit of every 32-bit instruction determines if the next instruction belongs to the same execute packet as the previous instruction, or whether it should be executed in the following clock as a part of the next execute packet. Fetch packets are always 256 bits wide; however, the execute packets can vary in size. The variable-length execute packets are a key memory-saving feature, distinguishing the C67x CPU from other VLIW architectures.

The CPU features two sets of functional units. Each set contains four units and a register file. One set contains functional units .L1, .S1, .M1, and .D1; the other set contains units .D2, .M2, .S2, and .L2. The two register files each contain 16 32-bit registers for a total of 32 general-purpose registers. The two sets of functional units, along with two register files, compose sides A and B of the CPU (see the functional block and CPU diagram and Figure 1). The four functional units on each side of the CPU can freely share the 16 registers belonging to that side. Additionally, each side features a single data bus connected to all the registers on the other side, by which the two sets of functional units can access data from the register files on the opposite side. While register access by functional units on the same side of the CPU as the register file can service all the units in a single clock cycle, register access using the register file across the CPU supports one read and one write per cycle.

The C67x CPU executes all C62x instructions. In addition to C62x fixed-point instructions, the six out of eight functional units (.L1, .S1, .M1, .M2, .S2, and .L2) also execute floating-point instructions. The remaining two functional units (.D1 and .D2) also execute the new LDDW instruction which loads 64 bits per CPU side for a total of 128 bits per cycle.

Another key feature of the C67x CPU is the load/store architecture, where all instructions operate on registers (as opposed to data in memory). Two sets of data-addressing units (.D1 and .D2) are responsible for all data transfers between the register files and the memory. The data address driven by the .D units allows data addresses generated from one register file to be used to load or store data to or from the other register file. The C67x CPU supports a variety of indirect addressing modes using either linear- or circular-addressing modes with 5- or 15-bit offsets. All instructions are conditional, and most can access any one of the 32 registers. Some registers, however, are singled out to support specific addressing or to hold the condition for conditional instructions (if the condition is not automatically “true”). The two .M functional units are dedicated for multiplies. The two .S and .L functional units perform a general set of arithmetic, logical, and branch functions with results available every clock cycle.

The processing flow begins when a 256-bit-wide instruction fetch packet is fetched from a program memory. The 32-bit instructions destined for the individual functional units are “linked” together by “1” bits in the least significant bit (LSB) position of the instructions. The instructions that are “chained” together for simultaneous execution (up to eight in total) compose an execute packet. A “0” in the LSB of an instruction breaks the chain, effectively placing the instructions that follow it in the next execute packet. If an execute packet crosses the fetch-packet boundary (256 bits wide), the assembler places it in the next fetch packet, while the remainder of the current fetch packet is padded with NOP instructions. The number of execute packets within a fetch packet can vary from one to eight. Execute packets are dispatched to their respective functional units at the rate of one per clock cycle and the next 256-bit fetch packet is not fetched until all the execute packets from the current fetch packet have been dispatched. After decoding, the instructions simultaneously drive all active functional units for a maximum execution rate of eight instructions every clock cycle. While most results are stored in 32-bit registers, they can be subsequently moved to memory as bytes or half-words as well. All load and store instructions are byte-, half-word, or word-addressable.

CPU (DSP core) description (continued)

† In addition to fixed-point instructions, these functional units execute floating-point instructions.

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## memory map summary

Table 2 shows the memory map address ranges of the C6711/C6711B/C6711C/C6711D devices. Internal memory is always located at address 0 and can be used as both program and data memory. The C6711/C6711B/C6711C/C6711D configuration registers for the common peripherals are located at the same hex address ranges. The external memory address ranges in the C6711/C6711B/C6711C/C6711D devices begin at the address location 0x8000 0000.

**Table 2. TMS320C6711/C6711B/C6711C/C6711D Memory Map Summary**

| MEMORY BLOCK DESCRIPTION                            | BLOCK SIZE (BYTES) | HEX ADDRESS RANGE     |
|-----------------------------------------------------|--------------------|-----------------------|
| Internal RAM (L2)                                   | 64K                | 0000 0000 – 0000 FFFF |
| Reserved                                            | 24M – 64K          | 0001 0000 – 017F FFFF |
| External Memory Interface (EMIF) Registers          | 256K               | 0180 0000 – 0183 FFFF |
| L2 Registers                                        | 256K               | 0184 0000 – 0187 FFFF |
| HPI Registers                                       | 256K               | 0188 0000 – 018B FFFF |
| McBSP 0 Registers                                   | 256K               | 018C 0000 – 018F FFFF |
| McBSP 1 Registers                                   | 256K               | 0190 0000 – 0193 FFFF |
| Timer 0 Registers                                   | 256K               | 0194 0000 – 0197 FFFF |
| Timer 1 Registers                                   | 256K               | 0198 0000 – 019B FFFF |

| McBSP 1 Data/Peripheral Data Bus                    | 64M                | 3400 0000 – 37FF FFFF |
| Reserved                                            | 64M                | 3800 0000 – 3BFF FFFF |
| Reserved                                            | 1G + 64M           | 3C00 0000 – 7FFF FFFF |
| EMIF CE0 <sup>†</sup>                               | 256M               | 8000 0000 – 8FFF FFFF |
| EMIF CE1 <sup>†</sup>                               | 256M               | 9000 0000 – 9FFF FFFF |
| EMIF CE2 <sup>†</sup>                               | 256M               | A000 0000 – AFFF FFFF |
| EMIF CE3 <sup>†</sup>                               | 256M               | B000 0000 – BFFF FFFF |
| Reserved                                            | 1G                 | C000 0000 – FFFF FFFF |

<sup>†</sup> The number of EMIF address pins (EA[21:2]) limits the maximum addressable memory (SDRAM) to 128MB per CE space. To get 256MB of addressable memory, additional general-purpose output pin or external logic is required.

## peripheral register descriptions

Table 3 through Table 14 identify the peripheral registers for the C6711/C6711B/C6711C/C6711D devices by their register names, acronyms, and hex address or hex address range. For more detailed information on the register contents, bit names, and their descriptions, see the specific peripheral reference guide listed in the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190).

**Table 3. EMIF Registers**

| HEX ADDRESS RANGE     | ACRONYM | REGISTER NAME              |
|-----------------------|---------|----------------------------|
| 0180 0000             | GBLCTL  | EMIF global control        |
| 0180 0004             | CECTL1  | EMIF CE1 space control     |
| 0180 0008             | CECTL0  | EMIF CE0 space control     |
| 0180 000C             | –       | Reserved                   |
| 0180 0010             | CECTL2  | EMIF CE2 space control     |
| 0180 0014             | CECTL3  | EMIF CE3 space control     |
| 0180 0018             | SDCTL   | EMIF SDRAM control         |

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## signal groups description

<sup>†</sup> The CLKOUT3 and PLLHV pin functions are applicable to the C6711C/C6711D device only.

<sup>‡</sup> For the C6711C/C6711D device, the CLKOUT2 pin is multiplexed with the GP[2] pin. Default function is CLKOUT2. To use this pin as GPIO, the GP2EN bit in the GPEN register and the GP2DIR bit in the GPDIR register must be properly configured.

<sup>§</sup> The CLKOUT1 pin function is applicable to the C6711/C6711B devices only.

<sup>¶</sup> These pins apply to the C6711/C6711B devices only. The C6711C/C6711D device has a different PLL module and PLL Controller; therefore, the PLLV, PLLG, and PLLF pins are not necessary on the C6711C/C6711D device.

<sup>#</sup> For the C6711C/C6711D device, the external interrupts (EXT\_INT[7–4]) go through the general-purpose input/output (GPIO) module. When used as interrupt inputs, the GP[7–4] pins must be configured as inputs (via the GPDIR register) and enabled (via the GPEN register) in addition to enabling the interrupts in the interrupt enable register (IER).

**Figure 3. CPU (DSP Core) and Peripheral Signals**

signal groups description (continued)

† For proper C6711C/C6711D device operation, these pins must be externally pulled up with a 10-kΩ resistor.

Figure 4. Peripheral Signals

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## signal groups description (continued)

<sup>†</sup> Only the C6711C/C6711D device supports the general-purpose input/output (GPIO) port peripheral.

**Figure 4. Peripheral Signals (Continued)**

---

## **DEVICE CONFIGURATIONS**

On the C6711/11B and C6711C/C6711D devices, bootmode and certain device configurations/peripheral selections are determined at device reset. For the C6711C/C6711D device only, other device configurations (e.g., EMIF input clock source) are software-configurable via the device configurations register (DEVCFG) [address location 0x019C0200] after device reset.

### **device configurations at device reset**

Table 15 describes the C6711/11B/11C/11D device configuration pins, which are set up via internal or external pullup/pulldown resistors through the HPI data pins (HD[4:3], HD8, HD12 [11D only]) and CLKMODE0 pin. These configuration pins must be in the desired state until reset is released. For more details on these device configuration pins, see the Terminal Functions table of this data sheet.

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For C6711/11B, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

For C6711C/11D, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-kΩ resistor (approximate) for the IPD or 18-kΩ resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 kΩ and 2.0 kΩ, respectively, should be used to pull a signal to the opposite supply rail.]

§ PLLV and PLLG are not part of external voltage supply or ground. See the CLOCK/PLL documentation for information on how to connect these pins [C6711/11B only].

¶ A = Analog signal (PLL Filter)

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For C6711/11B, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

For C6711C/11D, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-kΩ resistor (approximate) for the IPD or 18-kΩ resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 kΩ and 2.0 kΩ, respectively, should be used to pull a signal to the opposite supply rail.]

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For **C6711/11B**, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-k $\Omega$  IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-k $\Omega$  resistor should be used.)

For **C6711C/11D**, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-k $\Omega$  resistor (approximate) for the IPD or 18-k $\Omega$  resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 k $\Omega$  and 2.0 k $\Omega$ , respectively, should be used to pull a signal to the opposite supply rail.]

# To maintain signal integrity for the EMIF signals, serial termination resistors should be inserted into all EMIF output signal lines.

For proper C6711C/11D device operation, the DR1 pin should either be driven externally at all times or be pulled up with a 10-kΩ resistor to a valid logic level. Because it is common for some ICs to 3-state their outputs at times, a 10-kΩ pullup resistor may be desirable even when an external device is driving the pin.                                       |

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For **C6711/11B**, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

For **C6711C/11D**, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-kΩ resistor (approximate) for the IPD or 18-kΩ resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 kΩ and 2.0 kΩ, respectively, should be used to pull a signal to the opposite supply rail.]

⁴ To maintain signal integrity for the EMIF signals, serial termination resistors should be inserted into all EMIF output signal lines.

† I = Input, O = Output, Z = High impedance, S = Supply voltage, GND = Ground

‡ For **C6711/11B**, IPD = Internal pulldown, IPU = Internal pullup. (These IPD/IPU signal pins feature a 30-kΩ IPD or IPU resistor. To pull up a signal to the opposite supply rail, a 1-kΩ resistor should be used.)

For **C6711C/11D**, IPD = Internal pulldown, IPU = Internal pullup. [These IPD/IPU signal pins feature a 13-kΩ resistor (approximate) for the IPD or 18-kΩ resistor (approximate) for the IPU. An external pullup or pulldown resistor no greater than 4.4 kΩ and 2.0 kΩ, respectively, should be used to pull a signal to the opposite supply rail.]

## **development support**

TI offers an extensive line of development tools for the TMS320C6000™ DSP platform, including tools to evaluate the performance of the processors, generate code, develop algorithm implementations, and fully integrate and debug software and hardware modules.

The following products support development of C6000™ DSP-based applications:

### **Software Development Tools:**

Code Composer Studio™ Integrated Development Environment (IDE): including Editor

C/C++/Assembly Code Generation, and Debug plus additional development tools

Scalable, Real-Time Foundation Software (DSP/BIOS™), which provides the basic run-time target software needed to support any DSP application.

### **Hardware Development Tools:**

Extended Development System (XDS™) Emulator (supports C6000™ DSP multiprocessor system debug)  
EVM (Evaluation Module)

For a complete listing of development-support tools for the TMS320C6000™ DSP platform, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL). For information on pricing and availability, contact the nearest TI field sales office or authorized distributor.

## device and development-support tool nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all TMS320™ DSP devices and support tools. Each TMS320™ DSP commercial family member has one of three prefixes: TMX, TMP, or TMS. Texas Instruments recommends two of three possible prefix designators for support tools: TMDX and TMDS. These prefixes represent evolutionary stages of product development from engineering prototypes (TMX/TMDX) through fully qualified production devices/tools (TMS/TMDS).

Device development evolutionary flow:

|            |                                                                                                                                      |
|------------|--------------------------------------------------------------------------------------------------------------------------------------|
| <b>TMX</b> | Experimental device that is not necessarily representative of the final device's electrical specifications                           |
| <b>TMP</b> | Final silicon die that conforms to the device's electrical specifications but has not completed quality and reliability verification |
| <b>TMS</b> | Fully qualified production device                                                                                                    |

Support tool development evolutionary flow:

|             |                                                                                                          |
|-------------|----------------------------------------------------------------------------------------------------------|
| <b>TMDX</b> | Development-support product that has not yet completed Texas Instruments internal qualification testing. |
| <b>TMDS</b> | Fully qualified development-support product                                                              |

TMX and TMP devices and TMDX development-support tools are shipped with appropriate disclaimers describing their limitations and intended uses. Experimental devices (TMX) may not be representative of a final product and Texas Instruments reserves the right to change or discontinue these products without notice.

TMS devices and TMDS development-support tools have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (TMX or TMP) have a greater failure rate than the standard production devices. Texas Instruments recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the package type (for example, GDP), the temperature range (for example, blank is the default commercial temperature range and A is the extended temperature range), and the device speed range in megahertz (for example, -167 is 167 MHz).

Table 18 identifies the C6711/11B/11C/11D device part numbers (orderables). For more details and for ordering information, see the TI website ([www.ti.com](http://www.ti.com)). Figure 5 provides a legend for reading the complete device name for any TMS3206000™ DSP family member.

## documentation support

Extensive documentation supports all TMS320™ DSP family generations of devices from product announcement through applications development. The types of documentation available include: data sheets, such as this document, with design specifications; complete user's reference guides for all devices and tools; technical briefs; development-support tools; on-line help; and hardware and software applications. The following is a brief, descriptive list of support documentation specific to the C6000™ DSP devices:

The *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189) describes the C6000™ CPU (DSP core) architecture, instruction set, pipeline, and associated interrupts.

The *TMS320C6000 DSP Peripherals Overview Reference Guide* [hereafter referred to as the C6000 PRG Overview] (literature number SPRU190) provides an overview and briefly describes the functionality of the peripherals available on the C6000™ DSP platform of devices. This document also includes a table listing the peripherals available on the C6000 devices along with literature numbers and hyperlinks to the associated peripheral documents. These C6711C/C6711D peripherals, except the PLL, are similar to the peripherals on the TMS320C6711 and TMS320C64x devices; therefore, see the TMS320C6711 (C6711 or C67x) peripheral information, and in some cases, where indicated, see the TMS320C6711 (C6711 or TMS320C67x™ or C67x) peripheral information, and in some cases, where indicated, see the C64x information in the C6000 PRG Overview (literature number SPRU190).

*TMS320C6000 DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide* (literature number SPRU233) describes the functionality of the PLL peripheral available on the C6711C/11D device.

The *TMS320C6000 Technical Brief* (literature number SPRU197) gives an introduction to the TMS320C62x™/TMS320C67x™ devices, associated development tools, and third-party support.

The *Migrating from TMS320C6211B/6711B to TMS320C6711C* application report (literature number SPRA837) describes the differences and issues of interest related to migration from the Texas Instruments TMS320C6211, TMS320C6211B, TMS320C6711, and TMS320C6711B devices, GFN packages, to the TMS320C6711C device, GDP package.

The *TMS320C6711/TMS320C6711B/TMS320C6711C/TMS320C6711D Digital Signal Processors Silicon Errata* (C6711 Silicon Revisions 1.0, 1.2, and 1.3; C6711B Silicon Revisions 2.0 and 2.1; and C6711C Silicon Revision 1.1; and C6711D Silicon Revision 2.0) [literature number SPRZ173K or later] categorizes and describes the known exceptions to the functional specifications and usage notes for the TMS320C6711, TMS320C6711B, TMS320C6711C, and TMS320C6711D DSP devices.

The *TMS320C6713/12C/11C Power Consumption Summary* application report (literature number SPRA889) discusses the power consumption for user applications with the TMS320C6713, TMS320C6712C, and TMS320C6711C DSP devices.

The *Using IBIS Models for Timing Analysis* application report (literature number SPRA839) describes how to properly use IBIS models to attain accurate timing analysis for a given system.

The tools support documentation is electronically available within the Code Composer Studio™ Integrated Development Environment (IDE). For a complete listing of C6000™ DSP latest documentation, visit the Texas Instruments web site on the Worldwide Web at <http://www.ti.com> uniform resource locator (URL).

See the Worldwide Web URL for the application reports *How To Begin Development Today with the TMS320C6211 DSP* (literature number SPRA474) and *How To Begin Development with the TMS320C6711 DSP* (literature number SPRA522), which describe in more detail the similarities/differences between the C6211 and C6711 C6000™ DSP devices.

## CPU CSR register description

The CPU control status register (CSR) contains the CPU ID and CPU Revision ID (bits 16–31) as well as the status of the device power-down modes [PWRD field (bits 15–10)], program and data cache control modes, the endian bit (EN, bit 8) and the global interrupt enable (GIE, bit 0) and previous GIE (PGIE, bit 1). Figure 6 and Table 19 identify the bit fields in the CPU CSR register.

For more detailed information on the bit fields in the CPU CSR register, see the *TMS320C6000 DSP Peripherals Overview Reference Guide* (literature number SPRU190) and the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

**Legend:** R = Readable by the MVC instruction, R/W = Readable/Writeable by the MVC instruction; W = Read/write; -n = value after reset, -x = undefined value after reset, C = Clearable by the MVC instruction

## cache configuration (CCFG) register description (11D)

The C6711D device includes an enhancement to the cache configuration (CCFG) register. A “P” bit (CCFG.31) allows the programmer to select the priority of accesses to L2 memory originating from the transfer crossbar (TC) over accesses originating from the L1D memory system. An important class of TC accesses is EDMA transfers, which move data to or from the L2 memory. While the EDMA normally has no issue accessing L2 memory due to the high hit rates on the L1D memory system, there are pathological cases where certain CPU behavior could block the EDMA from accessing the L2 memory for long enough to cause a missed deadline when transferring data to a peripheral such as the McASP or McBSP. This can be avoided by setting the P bit to “1” because the EDMA will assume a higher priority than the L1D memory system when accessing L2 memory.

For more detailed information on the P-bit function and for silicon advisories concerning EDMA L2 memory accesses blocked, see the *TMS320C6711/TMS320C6711B/TMS320C6711C/TMS320C6711D Digital Signal Processors Silicon Errata* (literature number SPRZ173K or later).

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## interrupt sources and interrupt selector [C6711/11B only]

The C67x DSP core on the C6711/C6711B device supports 16 prioritized interrupts, which are listed in Table 21. The highest-priority interrupt is INT\_00 (dedicated to RESET) while the lowest-priority interrupt is INT\_15. The first four interrupts (INT\_00–INT\_03) are non-maskable and fixed. The remaining interrupts (INT\_04–INT\_15) are maskable and default to the interrupt source specified in Table 21. The interrupt source for interrupts 4–15 can be programmed by modifying the selector value (binary value) in the corresponding fields of the Interrupt Selector Control registers: MUXH (address 0x019C0000) and MUXL (address 0x019C0004).

**Table 21. C6711/C6711B DSP Interrupts**

| CPU INTERRUPT NUMBER | INTERRUPT SELECTOR CONTROL REGISTER | SELECTOR VALUE (BINARY) | INTERRUPT EVENT | INTERRUPT SOURCE                           |

<sup>†</sup> Interrupts INT\_00 through INT\_03 are non-maskable and fixed.

<sup>‡</sup> Interrupts INT\_04 through INT\_15 are programmable by modifying the binary selector values in the Interrupt Selector Control registers fields. Table 21 shows the default interrupt sources for interrupts INT\_04 through INT\_15. For more detailed information on interrupt sources and selection, see the *TMS320C6000 DSP Interrupt Selector Reference Guide* (literature number SPRU646).

## interrupt sources and interrupt selector [11C/11D only]

The C67x DSP core on the C6711C/C6711D supports 16 prioritized interrupts, which are listed in Table 22. The highest priority interrupt is INT\_00 (dedicated to RESET) while the lowest priority is INT\_15. The first four interrupts are non-maskable and fixed. The remaining interrupts (4–15) are maskable and default to the interrupt source listed in Table 22. However, their interrupt source may be reprogrammed to any one of the sources listed in Table 23 (Interrupt Selector). Table 23 lists the selector value corresponding to each of the alternate interrupt sources. The selector choice for interrupts 4–15 is made by programming the corresponding fields (listed in Table 22) in the MUXH (address 0x019C0000) and MUXL (address 0x019C0004) registers.

**Table 22. DSP Interrupts [C6711C/C6711D]**

| DSP INTERRUPT NUMBER | INTERRUPT SELECTOR CONTROL REGISTER | DEFAULT SELECTOR VALUE (BINARY) | DEFAULT INTERRUPT EVENT |

<sup>†</sup> Interrupt Events GPINT4, GPINT5, GPINT6, and GPINT7 are outputs from the GPIO module (GP). They originate from the device pins GP[4](EXT\_INT4), GP[5](EXT\_INT5), GP[6](EXT\_INT6), and GP[7](EXT\_INT7). These pins can be used as edge-sensitive EXT\_INTx with polarity controlled by the External Interrupt Polarity Register (EXTPOL.[3:0]). The corresponding pins must first be *enabled* in the GPIO module by setting the corresponding enable bits in the GP Enable Register (GPEN.[7:4]), and configuring them as *inputs* in the GP Direction Register (GPDIR.[7:4]). These interrupts can be controlled through the GPIO module in addition to the simple EXTPOL.[3:0] bits. For more information on interrupt control via the GPIO module, see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584). [C6711C/C6711D only].

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## EDMA channel synchronization events [C6711/11B only]

The C67x EDMA on the C6711/C6711B device supports up to 16 EDMA channels. Four of the sixteen channels (channels 8–11) are reserved for EDMA chaining, leaving 12 EDMA channels available to service peripheral devices. Table 24 lists the source of synchronization events associated with each of the programmable EDMA channels. For the C6711/11B, the association of an event to a channel is *fixed*; each of the EDMA channels has one specific event associated with it. For more detailed information on the EDMA module, associated channels, and event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

| EDMA CHANNEL    | EVENT NAME | EVENT DESCRIPTION                                 |
|-----------------|------------|---------------------------------------------------|
| 0               | DSP_INT    | Host-port interface (HPI)-to-DSP interrupt        |
| 1               | TINT0      | Timer 0 interrupt                                 |
| 2               | TINT1      | Timer 1 interrupt                                 |
| 3               | SD_INT     | EMIF SDRAM timer interrupt                        |
| 4               | EXT_INT4   | External interrupt pin 4                          |
| 5               | EXT_INT5   | External interrupt pin 5                          |
| 6               | EXT_INT6   | External interrupt pin 6                          |
| 7               | EXT_INT7   | External interrupt pin 7                          |
| 8 <sup>†</sup>  | EDMA_TCC8  | EDMA transfer complete code (TCC) 1000b interrupt |
| 9 <sup>†</sup>  | EDMA_TCC9  | EDMA TCC 1001b interrupt                          |
| 10 <sup>†</sup> | EDMA_TCC10 | EDMA TCC 1010b interrupt                          |
| 11 <sup>†</sup> | EDMA_TCC11 | EDMA TCC 1011b interrupt                          |
| 12              | XEVT0      | McBSP0 transmit event                             |
| 13              | REVT0      | McBSP0 receive event                              |
| 14              | XEVT1      | McBSP1 transmit event                             |
| 15              | REVT1      | McBSP1 receive event                              |

<sup>†</sup> EDMA channels 8 through 11 are used for transfer chaining only. For more detailed information on event-transfer chaining, see the *TMS320C6000 DSP Enhanced Direct Memory Access (EDMA) Controller Reference Guide* (literature number SPRU234).

## EDMA module and EDMA selector [C6711C/11D only]

The C67x EDMA for the C6711C/C6711D device also supports up to 16 EDMA channels. Four of the sixteen channels (channels 8–11) are reserved for EDMA chaining, leaving 12 EDMA channels available to service peripheral devices. On the C6711C/C6711D device, the user, through the EDMA selector registers, can control the EDMA channels servicing peripheral devices.

The EDMA selector registers are located at addresses 0x01A0FF00 (ESEL0), 0x01A0FF04 (ESEL1), and 0x01A0FF0C (ESEL3). These EDMA selector registers control the mapping of the EDMA events to the EDMA channels. Each EDMA event has an assigned EDMA selector code (see Table 26). By loading each EVTSELx register field with an EDMA selector code, users can map any desired EDMA event to any specified EDMA channel. Table 25 lists the default EDMA selector value for each EDMA channel.

See Table 27 and Table 28 for the EDMA Event Selector registers and their associated bit descriptions.

**Table 25. EDMA Channels [C6711C/C6711D Only]**

| EDMA CHANNEL | EDMA SELECTOR CONTROL REGISTER | DEFAULT SELECTOR VALUE (BINARY) | DEFAULT EDMA EVENT  |

|--------------------------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 31:30<br>23:22<br>15:14<br>7:6 | Reserved | Reserved. Read-only, writes have no effect.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| 29:24<br>21:16<br>13:8<br>5:0  | EVTSELx  | <p>EDMA event selection bits for channel x. Allows mapping of the EDMA events to the EDMA channels.</p> <p>The EVTSEL0 through EVTSEL15 bits correspond to the channels 0 to 15, respectively. These EVTSELx fields are user-selectable. By configuring the EVTSELx fields to the EDMA selector value of the desired EDMA sync event number (see Table 26), users can map any EDMA event to the EDMA channel.</p> <p>For example, if EVTSEL15 is programmed to 00 0001b (the EDMA selector code for TINT0), then channel 15 is triggered by Timer0 TINT0 events.</p> |

All of the internal C6711/11B clocks are generated from a single source through the CLKIN pin. This source clock either drives the PLL, which multiplies the source clock in frequency to generate the internal CPU clock, or bypasses the PLL to become the internal CPU clock.

To minimize the clock jitter, a single clean power supply should power both the C6711/11B device and the external clock oscillator circuit. Noise coupling into PLLF will directly impact PLL clock jitter. The minimum CLKIN rise and fall times should also be observed. For the input clock timing requirements, see the *input and output clocks* electricals section.

Rise/fall times, duty cycles (high/low pulse durations), and the load capacitance of the external clock source must meet the DSP requirements in this data sheet (see the *electrical characteristics over recommended ranges of supply voltage and operating case temperature* table and the *input and output clocks* electricals section). Table 29 lists some examples of compatible CLKIN external clock sources:

| COMPATIBLE PARTS FOR<br>EXTERNAL CLOCK SOURCES (CLKIN) | PART NUMBER               | MANUFACTURER               |
|--------------------------------------------------------|---------------------------|----------------------------|

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## clock PLL [C6711/11B only] (continued)

- NOTES: A. For a system with ONLY PLL x1 (bypass) mode, short the PLLF terminal to the PLLG terminal.  
 B. The 3.3-V supply for the EMI filter must be from the same 3.3-V power plane supplying the I/O voltage, DV<sub>DD</sub>.

**Figure 9. External PLL Circuitry for x1 (Bypass) Mode Only [C6711/11B]**

**Table 30. C6711/C6711B PLL Component Selection**

| CLKMODE | CLKIN RANGE (MHz) | CPU CLOCK FREQUENCY (CLKOUT1) RANGE (MHz) | CLKOUT2 RANGE (MHz) | R1 [±1%] (Ω) | C1 [±10%] (nF) | C2 [±10%] (pF) | TYPICAL LOCK TIME (μs) <sup>†</sup> |
|---------|-------------------|-------------------------------------------|---------------------|--------------|----------------|----------------|-------------------------------------|
| x4      | 16.3–41.6         | 65–167                                    | 32.5–83             | 60.4         | 27             | 560            | 75                                  |

<sup>†</sup> Under some operating conditions, the maximum PLL lock time may vary as much as 150% from the specified typical value. For example, if the typical lock time is specified as 100 μs, the maximum value may be as long as 250 μs.

The TMS320C6711C/C6711D includes a PLL and a flexible PLL controller peripheral consisting of a prescaler (D0) and four dividers (OSCDIV1, D1, D2, and D3). The PLL controller is able to generate different clocks for different parts of the system (i.e., DSP core, Peripheral Data Bus, External Memory Interface, McASP, and other peripherals). Figure 10 illustrates the PLL, the PLL controller, and the clock generator logic.

D. EMI filter manufacturer TDK part number ACF451832-333, -223, -153, -103. Panasonic part number EXCCET103U.

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## PLL and PLL controller [C6711C/C6711D only] (continued)

The PLL Reset Time is the amount of wait time needed when resetting the PLL (writing PLLRST=1), in order for the PLL to properly reset, before bringing the PLL out of reset (writing PLLRST = 0). For the PLL Reset Time value, see Table 31. The PLL Lock Time is the amount of time from when PLLRST = 0 with PLEN = 0 (PLL out of reset, but still bypassed) to when the PLEN bit can be safely changed to “1” (switching from bypass to the PLL path), see Table 31 and Figure 10.

Under some operating conditions, the maximum PLL Lock Time may vary from the specified typical value. For the PLL Lock Time values, see Table 31.

**Table 31. PLL Lock and Reset Times (C6711C/C6711D only)**

|                | MIN | TYP | MAX   | UNIT |
|----------------|-----|-----|-------|------|
| PLL Lock Time  |     | 75  | 187.5 | μs   |
| PLL Reset Time | 125 |     |       | ns   |

Table 32 shows the C6711C/C6711D device's CLKOUT signals, how they are derived and by what register control bits, and the default settings. For more details on the PLL, see the PLL and Clock Generator Logic diagram (Figure 10).

**Table 32. CLKOUT Signals, Default Settings, and Control**

| CLOCK OUTPUT<br>SIGNAL NAME | DEFAULT SETTING<br>(ENABLED or DISABLED) | CONTROL<br>BIT(s) (Register)                           | DESCRIPTION                                                                                                                |
|-----------------------------|------------------------------------------|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| CLKOUT2                     | ON (ENABLED)                             | D2EN = 1 (PLLDIV2.[15])<br>CK2EN = 1 (EMIF GBLCTL.[3]) | SYSClk2 selected [default]                                                                                                 |
| CLKOUT3                     | ON (ENABLED)                             | OD1EN = 1 (OSCDIV1.[15])                               | Derived from CLKIN                                                                                                         |
| ECLKOUT                     | ON (ENABLED);<br>derived from SYSClk3    | EKSRC = 0 (DEVCFG.[4])<br>EKEN = 1 (EMIF GBLCTL.[5])   | SYSClk3 selected [default].<br><br>To select ECLKIN as source:<br>EKSRC = 1 (DEVCFG.[4]) and<br>EKEN = 1 (EMIF GBLCTL.[5]) |

This input clock is directly available as an internal high-frequency clock source that may be divided down by a programmable divider OSCDIV1 (/1, /2, /3, ..., /32) and output on the CLKOUT3 pin for other use in the system.

Figure 10 shows that the input clock source may be divided down by divider PLLDIV0 (/1, /2, ..., /32) and then multiplied up by a factor of x4, x5, x6, and so on, up to x25.

Either the input clock (PLEN = 0) or the PLL output (PLEN = 1) then serves as the high-frequency reference clock for the rest of the DSP system. The DSP core clock, the peripheral bus clock, and the EMIF clock may be divided down from this high-frequency clock (each with a unique divider). For example, with a 40-MHz input, if the PLL output is configured for 400 MHz, the DSP core may be operated at 200 MHz (/2) while the EMIF may be configured to operate at a rate of 75 MHz (/6). Note that there is a specific minimum and maximum reference clock (PLLREF) and output clock (PLLOUT) for the block labeled PLL in Figure 10, as well as for the DSP core, peripheral bus, and EMIF. The clock generator must not be configured to exceed any of these constraints (certain combinations of external clock input, internal dividers, and PLL multiply ratios might not be supported). See Table 33 for the PLL clocks input and output frequency ranges.

**PLL and PLL controller [C6711C/C6711D only] (continued)**

**Table 33. PLL Clock Frequency Ranges<sup>†‡</sup>**

| CLOCK SIGNAL        | GDPA-167<br>GDP-200 |                         | UNIT |
|---------------------|---------------------|-------------------------|------|
|                     | MIN                 | MAX                     |      |
| PLLREF (PLLEN = 1)  | 12                  | 100                     | MHz  |
| PLLOUT              | 140                 | 600                     | MHz  |
| SYSClk1             | –                   | Device Speed (DSP Core) | MHz  |
| SYSClk3 (EKSRC = 0) | –                   | 100                     | MHz  |

<sup>†</sup> SYSClk2 rate **must** be exactly half of SYSClk1.

<sup>‡</sup> Also see the electrical specification (timing requirements and switching characteristics parameters) in the Input and Output Clocks section of this data sheet.

The EMIF itself may be clocked by an external reference clock via the ECLKIN pin or can be generated on-chip as SYSClk3. SYSClk3 is derived from divider D3 off of PLLOUT (see Figure 10, PLL and Clock Generator Logic). The EMIF clock selection is programmable via the EKSRC bit in the DEVCFG register.

The settings for the PLL multiplier and each of the dividers in the clock generation block may be reconfigured via software at run time. If either the input to the PLL changes due to D0, CLKMODE0, or CLKIN, or if the PLL multiplier is changed, then software must enter bypass first and stay in bypass until the PLL has had enough time to lock (see electrical specifications). For the programming procedure, see the *TMS320C6000 DSP Software-Programmable Phase-Locked Loop (PLL) Controller Reference Guide* (literature number SPRU233).

SYSClk2 is the internal clock source for peripheral bus control. SYSClk2 (Divider D2) **must** be programmed to be half of the SYSClk1 rate. For example, if D1 is configured to divide-by-2 mode (/2), then D2 **must** be programmed to divide-by-4 mode (/4). SYSClk2 is also tied directly to CLKOUT2 pin (see Figure 10).

During the programming transition of Divider D1 and Divider D2 (resulting in SYSClk1 and SYSClk2 output clocks, see Figure 10), the order of programming the PLLDIV1 and PLLDIV2 registers must be observed to ensure that SYSClk2 always runs at half the SYSClk1 rate or slower. For example, if the divider ratios of D1 and D2 are to be changed from /1, /2 (respectively) to /5, /10 (respectively) then, the PLLDIV2 register must be programmed before the PLLDIV1 register. The transition ratios become /1, /2; /1, /10; and then /5, /10. If the divider ratios of D1 and D2 are to be changed from /3, /6 to /1, /2 then, the PLLDIV1 register must be programmed before the PLLDIV2 register. The transition ratios, for this case, become /3, /6; /1, /6; and then /1, /2. The final SYSClk2 rate **must** be exactly half of the SYSClk1 rate.

Note that Divider D1 and Divider D2 **must always** be enabled (i.e., D1EN and D2EN bits are set to “1” in the PLLDIV1 and PLLDIV2 registers).

The PLL Controller registers should be modified only by the CPU or via emulation. The HPI should **not** be used to directly access the PLL Controller registers.

For detailed information on the clock generator (PLL Controller registers) and their associated software bit descriptions, see Table 34 through Table 37.

<sup>‡</sup> Note that SYSCLK2 *must* run at half the rate of SYSCLK1. Therefore, the divider ratio of D2 must be two times slower than D1. For example, if D1 is set to /2, then D2 *must* be set to /4.

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## general-purpose input/output (GPIO) [11C/11D only]

To use the GP[7:4, 2] software-configurable GPIO pins, the GPxEN bits in the GP Enable (GPEN) Register and the GPxDIR bits in the GP Direction (GPDIR) Register must be properly configured.

GPxEN = 1 GP[x] pin is enabled

GPxDIR = 0 GP[x] pin is an input

GPxDIR = 1 GP[x] pin is an output

where “x” represents one of the 7 through 4, or 2 GPIO pins

Figure 11 shows the GPIO enable bits in the GPEN register for the C6711C/C6711D device. To use any of the GPx pins as general-purpose input/output functions, the corresponding GPxEN bit must be set to “1” (enabled). Default values are device-specific, so refer to Figure 11 for the C6711C/C6711D default configuration.

**Legend:** R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

**Figure 11. GPIO Enable Register (GPEN) [Hex Address: 01B0 0000]**

Figure 12 shows the GPIO direction bits in the GPDIR register. This register determines if a given GPIO pin is an input or an output providing the corresponding GPxEN bit is enabled (set to “1”) in the GPEN register. By default, all the GPIO pins are configured as input pins.

**Legend:** R/W = Readable/Writeable; -n = value after reset, -x = undefined value after reset

**Figure 12. GPIO Direction Register (GPDIR) [Hex Address: 01B0 0004]**

For more detailed information on general-purpose inputs/outputs (GPIOs), see the *TMS320C6000 DSP General-Purpose Input/Output (GPIO) Reference Guide* (literature number SPRU584).

## power-down mode logic

Figure 13 shows the power-down mode logic on the C6711/11B/11C/11D.

<sup>†</sup> External input clocks, with the exception of CLKOUT3 [11C/11D only] and CLKIN, are *not* gated by the power-down mode logic.

<sup>‡</sup> CLKOUT1 is applicable on the C6711 and C6711B devices only.

**Figure 13. Power-Down Mode Logic<sup>†</sup>**

## triggering, wake-up, and effects

The power-down modes and their wake-up methods are programmed by setting the PWRD field (bits 15–10) of the control status register (CSR). The PWRD field of the CSR is shown in Figure 14 and described in Table 38. When writing to the CSR, all bits of the PWRD field should be set at the same time. Logic 0 should be used when “writing” to the reserved bit (bit 15) of the PWRD field. The CSR is discussed in detail in the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D  
FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

**Legend:** R/W-x = Read/write reset value  
**NOTE:** The shadowed bits are not part of the power-down logic discussion and therefore are not covered here. For information on these other bit fields in the CSR register, see the *TMS320C6000 CPU and Instruction Set Reference Guide* (literature number SPRU189).

**Figure 14. PWRD Field of the CSR Register**

A delay of up to nine clock cycles may occur after the instruction that sets the PWRD bits in the CSR before the PD mode takes effect. As best practice, NOPs should be padded after the PWRD bits are set in the CSR to account for this delay.

If PD1 mode is terminated by a non-enabled interrupt, the program execution returns to the instruction where PD1 took effect. If PD1 mode is terminated by an enabled interrupt, the interrupt service routine will be executed first, then the program execution returns to the instruction where PD1 took effect. In the case with an enabled interrupt, the GIE bit in the CSR and the NMIE bit in the interrupt enable register (IER) must also be set in order for the interrupt service routine to execute; otherwise, execution returns to the instruction where PD1 took effect upon PD1 mode termination by an enabled interrupt.

PD2 and PD3 modes can only be aborted by device reset. Table 38 summarizes all the power-down modes.

**Table 38. Characteristics of the Power-Down Modes**

| PRWD FIELD<br>(BITS 15–10) | POWER-DOWN<br>MODE | WAKE-UP METHOD                              | EFFECT ON CHIP'S OPERATION                                                                                                                                                                                                                                                                                                                                                                               |

During PD1, EDMA transactions can proceed between peripherals and internal memory.                                                                                                                                        |
| 010001                     | PD1                | Wake by an enabled or non-enabled interrupt |                                                                                                                                                                                                                                                                                                                                                                                                          |
| 011010                     | PD2 <sup>†</sup>   | Wake by a device reset                      | Output clock from PLL is halted, stopping the internal clock structure from switching and resulting in the entire chip being halted. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off.                                                                                                                               |
| 011100                     | PD3 <sup>†</sup>   | Wake by a device reset                      | Input clock to the PLL stops generating clocks. All register and internal RAM contents are preserved. All functional I/O "freeze" in the last state when the PLL clock is turned off. Following reset, the PLL needs time to re-lock, just as it does following power-up. Wake-up from PD3 takes longer than wake-up from PD2 because the PLL needs to be re-locked, just as it does following power-up. |
| All others                 | Reserved           | —                                           | —                                                                                                                                                                                                                                                                                                                                                                                                        |

<sup>†</sup> When entering PD2 and PD3, all functional I/O remains in the previous state. However, for peripherals which are asynchronous in nature or peripherals with an external clock source, output signals may transition in response to stimulus on the inputs. Under these conditions, peripherals will not operate according to specifications.

On C6711D silicon revision 2.0 and C6711C silicon revision 1.1, the device includes a programmable PLL which allows software control of PLL bypass via the PLEN bit in the PLLCSR register. With this enhanced functionality come some additional considerations when entering power-down modes.

The power-down modes (PD2 and PD3) function by disabling the PLL to stop clocks to the device. However, if the PLL is bypassed (PLEN = 0), the device will still receive clocks from the external clock input (CLKIN). Therefore, bypassing the PLL makes the power-down modes PD2 and PD3 ineffective.

Make sure that the PLL is enabled by writing a "1" to PLEN bit (PLLCSR.0) before writing to either PD3 (CSR.11) or PD2 (CSR.10) to enter a power-down mode.

### power-supply sequencing

TI DSPs do not require specific power sequencing between the core supply and the I/O supply. However, systems should be designed to ensure that neither supply is powered up for extended periods of time (>1 second) if the other supply is below the proper operating voltage.

### system-level design considerations

System-level design considerations, such as bus contention, may require supply sequencing to be implemented. In this case, for **C6711/11B**, the core supply should be powered up at the same time as, or prior to (and powered down after) the I/O buffers. For **C6711C/11D**, the core supply should be powered up prior to (and powered down after) the I/O buffers. This is to ensure that the I/O buffers receive valid inputs from the core before the output buffers are powered up, thus, preventing bus contention with other chips on the board.

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## power-supply design considerations

A dual-power supply with simultaneous sequencing can be used to eliminate the delay between core and I/O power up. A Schottky diode can also be used to tie the core rail to the I/O rail (see Figure 15).

**Figure 15. Schottky Diode Diagram**

Core and I/O supply voltage regulators should be located close to the DSP (or DSP array) to minimize inductance and resistance in the power delivery path. Additionally, when designing for high-performance applications utilizing the C6000™ platform of DSPs, the PC board should include separate power planes for core, I/O, and ground, all bypassed with high-quality low-ESL/ESR capacitors.

### ***C6711/11B device applicable only***

On systems using C62x and C67x DSPs, like the C6711/C6711B device, the core may consume in excess of 2 A per DSP until the I/O supply powers on. This extra current results from uninitialized logic within the DSP(s). A normal current state returns once the I/O power supply turns on and the CPU sees a clock pulse. Decreasing the amount of time between the core supply power-up and the I/O supply power-up reduces the effects of the current draw. If the external supply to the DSP core cannot supply the excess current, the minimum core voltage may not be achieved until after normal current returns. This voltage starvation of the core supply during power up will not affect run-time operation. Voltage starvation can affect power supply systems that gate the I/O supply via the core supply, causing the I/O supply to never turn on. During the transition from excess to normal current, a voltage spike may be seen on the core supply. Care must be taken when designing overvoltage protection circuitry on the core supply to not restart the power sequence due to this spike. Otherwise, the supply may cycle indefinitely.

## **power-supply decoupling**

In order to properly decouple the supply planes from system noise, place as many capacitors (caps) as possible close to the DSP. Assuming 0603 caps, the user should be able to fit a total of 60 caps — 30 for the core supply and 30 for the I/O supply. These caps need to be close (no more than 1.25 cm maximum distance) to the DSP to be effective. Physically smaller caps are better, such as 0402, but the size needs to be evaluated from a yield/manufacturing point-of-view. Parasitic inductance limits the effectiveness of the decoupling capacitors, therefore physically smaller capacitors should be used while maintaining the largest available capacitance value. As with the selection of any component, verification of capacitor availability over the product's production lifetime needs to be considered.

## **IEEE 1149.1 JTAG compatibility statement**

The TMS320C6711/11B/11C/11D DSP requires that both  $\overline{\text{TRST}}$  and  $\overline{\text{RESET}}$  resets be asserted upon power up to be properly initialized. While  $\overline{\text{RESET}}$  initializes the DSP core,  $\overline{\text{TRST}}$  initializes the DSP's emulation logic. Both resets are required for proper operation.

While both  $\overline{\text{TRST}}$  and  $\overline{\text{RESET}}$  need to be asserted upon power up, only  $\overline{\text{RESET}}$  needs to be released for the DSP to boot properly.  $\overline{\text{TRST}}$  may be asserted indefinitely for normal operation, keeping the JTAG port interface and DSP's emulation logic in the reset state.

$\overline{\text{TRST}}$  only needs to be released when it is necessary to use a JTAG controller to debug the DSP or exercise the DSP's boundary scan functionality.

For maximum reliability, the TMS320C6711/11B/11C/11D DSP includes an internal pulldown (IPD) on the  $\overline{\text{TRST}}$  pin to ensure that  $\overline{\text{TRST}}$  will always be asserted upon power up and the DSP's internal emulation logic will always be properly initialized.

JTAG controllers from Texas Instruments actively drive  $\overline{\text{TRST}}$  high. However, some third-party JTAG controllers may not drive  $\overline{\text{TRST}}$  high but expect the use of an external pullup resistor on  $\overline{\text{TRST}}$ .

When using this type of JTAG controller, assert  $\overline{\text{TRST}}$  to initialize the DSP after powerup and externally drive  $\overline{\text{TRST}}$  high before attempting any emulation or boundary scan operations. Following the release of  $\overline{\text{RESET}}$ , the low-to-high transition of  $\overline{\text{TRST}}$  must be "seen" to latch the state of EMU1 and EMU0. The EMU[1:0] pins configure the device for either Boundary Scan mode or Emulation mode. For more detailed information, see the terminal functions section of this data sheet.

## **EMIF device speed (C6711/C6711B)**

TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings to determine if the maximum EMIF speed is achievable for a given board layout. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## EMIF device speed (C6711C/C6711D only)

The maximum EMIF speed on the C6711C/C6711D device is 100 MHz. TI recommends utilizing I/O buffer information specification (IBIS) to analyze all AC timings to determine if the maximum EMIF speed is achievable for a given board layout. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839).

For ease of design evaluation, Table 39 contains IBIS simulation results showing the maximum EMIF-SDRAM interface speeds for the given example boards (TYPE) and SDRAM speed grades. Timing analysis should be performed to verify that all AC timings are met for the specified board layout. Other configurations are also possible, but again, timing analysis must be done to verify proper AC timings.

To maintain signal integrity, serial termination resistors should be inserted into all EMIF output signal lines (see the Terminal Functions table for the EMIF output signals).

**Table 39. C6711C/C6711D Example Boards and Maximum EMIF Speed**

| BOARD CONFIGURATION     |                                                                                           |                                                                                                                   | SDRAM SPEED GRADE          | MAXIMUM ACHIEVABLE<br>EMIF-SDRAM<br>INTERFACE SPEED                                                                                              |

NOTE 1: Results are based on IBIS simulations for the given example boards (TYPE). Timing analysis should be performed to determine if timing requirements can be met for the particular system.

### EMIF big endian mode correctness [C6711D only]

The HD8 pin device endian mode (LENDIAN) selects the endian mode of operation (Little or Big Endian). For the C6711C/11D device Little Endian is the default setting.

The C6711D HD12 pin (EMIF Big Endian Mode Correctness) [ $\overline{\text{EMIFBE}}$ ] enhancement allows the flexibility to change the EMIF data placement on the EMIF bus.

When using the default setting of HD12 = 1 for the C6711D, the EMIF will present 8-bit and 16-bit data on the ED[7:0] side of the bus if using Little Endian mode (HD8 = 1) and to the ED[31:24] side of the bus if using Big Endian mode. Figure 16 shows the mapping of 16-bit and 8-bit C6711D devices with EMIF endianness correction.

**Figure 17. 16/8-Bit EMIF Big Endian Mode Correctness Mapping (HD12 = 0) [C6711D Only]**

This *new* C6711D endianness correction functionality does not affect systems using the default value of HD12=1.

This *new* feature does *not* affect systems operating in Little Endian mode.

### bootmode

The C67x™ device resets using the active-low signal  $\overline{\text{RESET}}$  and the internal reset signal (C6711C/C6711D; for the C6711/C6711B device, the  $\overline{\text{RESET}}$  signal is the same as the internal reset signal). While  $\overline{\text{RESET}}$  is low, the internal reset is also asserted and the device is held in reset and is initialized to the prescribed reset state. Refer to reset timing for reset timing characteristics and states of device pins during reset. The release of the internal reset signal (see the Reset Phase 3 discussion in the Reset Timing section of this data sheet) starts the processor running with the prescribed device configuration and boot mode.

# TMS320C6711, TMS320C6711B, TMS320C6711C, TMS320C6711D FLOATING-POINT DIGITAL SIGNAL PROCESSORS

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

The C6711/C6711B/C6711C/C6711D has three types of boot modes:

- Host boot

If host boot is selected, upon release of internal reset, the CPU is internally “stalled” while the remainder of the device is released. During this period, an external host can initialize the CPU’s memory space as necessary through the host interface, including internal configuration registers, such as those that control the EMIF or other peripherals. Once the host is finished with all necessary initialization, it must set the DSPINT bit in the HPIC register to complete the boot process. This transition causes the boot configuration logic to bring the CPU out of the “stalled” state. The CPU then begins execution from address 0. The DSPINT condition is not latched by the CPU, because it occurs while the CPU is still internally “stalled”. Also, DSPINT brings the CPU out of the “stalled” state only if the host boot process is selected. All memory may be written to and read by the host. This allows for the host to verify what it sends to the DSP if required. After the CPU is out of the “stalled” state, the CPU needs to clear the DSPINT, otherwise, no more DSPINTs can be received.

- Emulation boot

Emulation boot mode is a variation of host boot. In this mode, it is not necessary for a host to load code or to set DSPINT to release the CPU from the “stalled” state. Instead, the emulator will set DSPINT if it has not been previously set so that the CPU can begin executing code from address 0. Prior to beginning execution, the emulator sets a breakpoint at address 0. This prevents the execution of invalid code by halting the CPU prior to executing the first instruction. Emulation boot is a good tool in the debug phase of development.

- EMIF boot (using default ROM timings)

Upon the release of internal reset, the 1K-Byte ROM code located in the beginning of  $\overline{CE1}$  is copied to address 0 by the EDMA using the default ROM timings, while the CPU is internally “stalled”. The data should be stored in the endian format that the system is using. The boot process also lets you choose the width of the ROM. In this case, the EMIF automatically assembles consecutive 8-bit bytes or 16-bit half-words to form the 32-bit instruction words to be copied. The transfer is automatically done by the EDMA as a single-frame block transfer from the ROM to address 0. After completion of the block transfer, the CPU is released from the “stalled” state and start running from address 0.

| Storage temperature range, $T_{stg}$                               | –65°C to 150°C              |

<sup>†</sup> Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTE 2: All voltage values are with respect to  $V_{SS}$ .

|                  |                                                 | CLKS1 and DR1                                                        |                   |                   | 3                    |      |
| T <sub>C</sub>   | Operating case temperature                      | Default                                                              | 0                 |                   | 90                   | °C   |
|                  |                                                 | A version (C6711BGFNA and C6711CGDPA only)                           | –40               |                   | 105                  | °C   |

<sup>‡</sup> For the C6711/11B device, the core supply should be powered up at the same time as, or prior to (and powered down after), the I/O supply. For the C6711C/11D device, the core supply should be powered up prior to (and powered down after), the I/O supply. Systems should be designed to ensure that neither supply is powered up for an extended period of time if the other supply is below the proper operating voltage.

<sup>§</sup> These values are compatible with existing 1.26V designs.

<sup>¶</sup> Refers to DC (or steady state) currents only, actual switching currents are higher. For more details, see the device-specific IBIS models.

<sup>†</sup> For test conditions shown as MIN, MAX, or NOM, use the appropriate value specified in the recommended operating conditions table.

<sup>‡</sup> For the **C6711C/C6711D** device, these currents were measured with average activity (50% high/50% low power) at 25°C case temperature and 100-MHz EMIF. This model represents a device performing high-DSP-activity operations 50% of the time, and the remainder performing low-DSP-activity operations. The high/low-DSP-activity models are defined as follows:

High-DSP-Activity Model:

CPU: 8 instructions/cycle with 2 LDDW instructions [L1 Data Memory: 128 bits/cycle via LDDW instructions;  
L1 Program Memory: 256 bits/cycle; L2/EMIF EDMA: 50% writes, 50% reads to/from SDRAM (50% bit-switching)]  
McBSP: 2 channels at E1 rate  
Timers: 2 timers at maximum rate

Low-DSP-Activity Model:

CPU: 2 instructions/cycle with 1 LDH instruction [L1 Data Memory: 16 bits/cycle; L1 Program Memory: 256 bits per 4 cycles;  
L2/EMIF EDMA: None]  
McBSP: 2 channels at E1 rate  
Timers: 2 timers at maximum rate

The actual current draw is highly application-dependent. For more details on core and I/O activity, refer to the *TMS320C6713/12C/11C Power Consumption Summary* application report (literature number SPRA889).

## PARAMETER MEASUREMENT INFORMATION

**Figure 18. Test Load Circuit for AC Timing Measurements for C6711/C6711B Only**

NOTE: The data sheet provides timing at the device pin. For output timing analysis, the tester pin electronics and its transmission line effects must be taken into account. A transmission line with a delay of 2 ns or longer can be used to produce the desired transmission line effect. The transmission line is intended as a load only. It is not necessary to add or subtract the transmission line delay (2 ns or longer) from the data sheet timings.

Input requirements in this data sheet are tested with an input slew rate of < 4 Volts per nanosecond (4 V/ns) at the device pin.

**Figure 19. Test Load Circuit for AC Timing Measurements for C6711C/C6711D Only**

## PARAMETER MEASUREMENT INFORMATION (CONTINUED)

### signal transition levels

All input and output timing parameters are referenced to 1.5 V for both “0” and “1” logic levels.

Figure 20. Input and Output Voltage Reference Levels for AC Timing Measurements

All rise and fall transition timing parameters are referenced to  $V_{IL\ MAX}$  and  $V_{IH\ MIN}$  for input clocks, and  $V_{OL\ MAX}$  and  $V_{OH\ MIN}$  for output clocks.

Figure 21. Rise and Fall Transition Time Voltage Reference Levels

### timing parameters and board routing analysis

The timing parameter values specified in this data sheet do *not* include delays by board routings. As a good board design practice, such delays must *always* be taken into account. Timing values may be adjusted by increasing/decreasing such delays. TI recommends utilizing the available I/O buffer information specification (IBIS) models to analyze the timing characteristics correctly. To properly use IBIS models to attain accurate timing analysis for a given system, see the *Using IBIS Models for Timing Analysis* application report (literature number SPRA839). If needed, external logic hardware such as buffers may be used to compensate any timing differences.

For example:

- In typical boards with the C6711B commercial temperature device, the routing delay improves the external memory's ability to meet the DSP's EMIF data input hold time requirement [ $t_{h(EKOH-EDV)}$ ].
- In some boards with the C6711BGFNA extended temperature device, the routing delay improves the external memory's ability to meet the DSP's EMIF data input hold time requirement [ $t_{h(EKOH-EDV)}$ ]. In addition, it may be necessary to add an extra delay to the input clock of the external memory to robustly meet the DSP's data input hold time requirement. If the extra delay approach is used, memory bus frequency adjustments may be needed to ensure the DSP's input setup time requirement [ $t_{su(EDV-EKOH)}$ ] is still maintained.

For inputs, timing is most impacted by the round-trip propagation delay from the DSP to the external device and from the external device to the DSP. This round-trip delay tends to negatively impact the input setup time margin, but also tends to improve the input hold time margins (see Table 40 and Figure 22).

Figure 22 represents a general transfer between the DSP and an external device. The figure also represents board route delays and how they are perceived by the DSP and the external device.

**(see Figure 25) [C6711C/C6711D]**

| NO. | PARAMETER                                   | GDPA-167<br>–200<br>–250 (6711D) |                | UNIT |
|-----|---------------------------------------------|----------------------------------|----------------|------|
|     |                                             | MIN                              | MAX            |      |
| 1   | $t_{c(CKO2)}$ Cycle time, CLKOUT2           | $C2 - 0.8$                       | $C2 + 0.8$     | ns   |
| 2   | $t_{w(CKO2H)}$ Pulse duration, CLKOUT2 high | $(C2/2) - 0.8$                   | $(C2/2) + 0.8$ | ns   |
| 3   | $t_{w(CKO2L)}$ Pulse duration, CLKOUT2 low  | $(C2/2) - 0.8$                   | $(C2/2) + 0.8$ | ns   |
| 4   | $t_{t(CKO2)}$ Transition time, CLKOUT2      |                                  | 2              | ns   |

<sup>†</sup> The reference points for the rise and fall transitions are measured at  $V_{OL}$  MAX and  $V_{OH}$  MIN.

<sup>‡</sup>  $C2$  = CLKOUT2 period in ns. CLKOUT2 period is determined by the PLL controller output SYSCLK2 period, which **must** be set to CPU period divide-by-2.

**Figure 26. CLKOUT2 Timings**

**switching characteristics over recommended operating conditions for CLKOUT3<sup>†§</sup>**  
**(see Figure 27) [C6711C/C6711D only]**

**timing requirements for asynchronous memory cycles<sup>†‡§</sup> (see Figure 30–Figure 31) [11C/11D]**

| NO. |                                                                       | GDPA-167<br>–200<br>–250 (6711D) |     | UNIT |
|-----|-----------------------------------------------------------------------|----------------------------------|-----|------|
|     |                                                                       | MIN                              | MAX |      |
| 3   | $t_{su}(EDV-AREH)$ Setup time, EDx valid before $\overline{ARE}$ high | 6.5                              |     | ns   |
| 4   | $t_h(AREH-EDV)$ Hold time, EDx valid after $\overline{ARE}$ high      | 1                                |     | ns   |
| 6   | $t_{su}(ARDY-EKOH)$ Setup time, ARDY valid before ECLKOUT high        | 3                                |     | ns   |
| 7   | $t_h(EKOH-ARDY)$ Hold time, ARDY valid after ECLKOUT high             | 2.3                              |     | ns   |

<sup>†</sup> To ensure data setup time, simply program the strobe width wide enough. ARDY is internally synchronized. The ARDY signal is recognized in the cycle for which the setup and hold time is met. To use ARDY as an asynchronous input, the pulse width of the ARDY signal should be wide enough (e.g., pulse width = 2E) to ensure setup and hold time is met.

<sup>‡</sup> RS = Read setup, RST = Read strobe, RH = Read hold, WS = Write setup, WST = Write strobe, WH = Write hold. These parameters are programmed via the EMIF CE space control registers.

<sup>§</sup> E = ECLKOUT period in ns

|     |                                                                   | MIN                              | MAX |      |
| 6   | $t_{su}(EDV-EKOH)$ Setup time, read EDx valid before ECLKOUT high | 1.5                              |     | ns   |
| 7   | $t_h(EKOH-EDV)$ Hold time, read EDx valid after ECLKOUT high      | 2.5                              |     | ns   |

<sup>†</sup> The C6711/11B/11C/11D SBSRAM interface takes advantage of the internal burst counter in the SBSRAM. Accesses default to incrementing 4-word bursts, but random bursts and decrementing bursts are done by interrupting bursts in progress. All burst types can sustain continuous data flow.

<sup>‡</sup> Make sure the external SBSRAM meets the timing specifications of the C6711 device. Delays or buffers may be needed to compensate for any timing differences. IBIS analysis should be used to correctly model the system interface.

## RESET TIMING [C6711/11B]

### timing requirements for reset<sup>†</sup> (see Figure 43)

| NO. |              |                                                                             | -100<br>-150 | UNIT |
|-----|--------------|-----------------------------------------------------------------------------|--------------|------|
|     |              |                                                                             | MIN MAX      |      |
| 1   | $t_{w(RST)}$ | Width of the RESET pulse (PLL stable) <sup>‡</sup>                          | 10P          | ns   |
|     |              | Width of the RESET pulse (PLL needs to sync up) <sup>§</sup>                | 250          | μs   |
| 14  | $t_{su(HD)}$ | Setup time, HD boot configuration bits valid before RESET high <sup>¶</sup> | 2P           | ns   |
| 15  | $t_h(HD)$    | Hold time, HD boot configuration bits valid after RESET high <sup>¶</sup>   | 2P           | ns   |

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>‡</sup> This parameter applies to CLKMODE x1 when CLKIN is stable, and applies to CLKMODE x4 when CLKIN and PLL are stable.

<sup>§</sup> This parameter applies to CLKMODE x4 only (it does not apply to CLKMODE x1). The RESET signal is not connected internally to the clock PLL circuit. The PLL, however, may need up to 250 μs to stabilize following device power up or after PLL configuration has been changed. During that time, RESET must be asserted to ensure proper device operation. See the *clock PLL* section for PLL lock times.

<sup>¶</sup> HD[4:3] are the boot configuration pins during device reset.

### switching characteristics over recommended operating conditions during reset<sup>†#||</sup> (see Figure 43)

| NO. | PARAMETER          |                                                          | -100<br>-150<br>-250 (6711D) | UNIT |

| 9   | $t_d(\text{RSTL-EMIFZHZ})$ | Delay time, RESET low to EMIF Z group high impedance <sup>††</sup>                               | 0                                |     | ns   |
| 10  | $t_d(\text{RSTL-EMIFLIV})$ | Delay time, RESET low to EMIF low group (BUSREQ) invalid <sup>††</sup>                           | 0                                |     | ns   |
| 11  | $t_d(\text{RSTL-Z1HZ})$    | Delay time, RESET low to Z group 1 high impedance <sup>††</sup>                                  | 0                                |     | ns   |
| 12  | $t_d(\text{RSTL-Z2HZ})$    | Delay time, RESET low to Z group 2 high impedance <sup>††</sup>                                  | 0                                |     | ns   |

<sup>†</sup> P = 1/CPU clock frequency in ns.

Note that while internal reset is asserted low, the CPU clock (SYSCLK1) period is equal to the input clock (CLKIN) period multiplied by 8. For example, if the CLKIN period is 20 ns, then the CPU clock (SYSCLK1) period is 20 ns x 8 = 160 ns. Therefore, P = SYSCLK1 = 160 ns while internal reset is asserted.

<sup>#</sup> The internal reset is stretched exactly 512 x CLKIN cycles if CLKIN is used (CLKMODE0 = 1). If the input clock (CLKIN) is not stable when RESET is deasserted, the actual delay time may vary.

<sup>††</sup> EMIF Z group consists of: EA[21:2], ED[31:0], CE[3:0], BE[3:0], ARE/SDCAS/SSADS, AWE/SDWE/SSWE, AOE/SDRAS/SSOE and HOLDA

EMIF low group consists of: BUSREQ

Z group 1 consists of: CLKR0, CLKR1, CLKX0, CLKX1, FSR0, FSR1, FSX0, FSX1, DX0, DX1, TOUT0, and TOUT1.

Z group 2 consists of: All other HPI and GPIO signals

### RESET TIMING [C6711C/11D] (CONTINUED)

**Figure 44. Reset Timing [C6711C/11D]**

**Reset Phase 1:** The  $\overline{\text{RESET}}$  pin is asserted. During this time, all internal clocks are running at the CLKIN frequency divide-by-8. The CPU is also running at the CLKIN frequency divide-by-8.

**Reset Phase 2:** The  $\overline{\text{RESET}}$  pin is deasserted but the internal reset is stretched. During this time, all internal clocks are running at the CLKIN frequency divide-by-8. The CPU is also running at the CLKIN frequency divide-by-8.

**Reset Phase 3:** Both the  $\overline{\text{RESET}}$  pin and internal reset are deasserted. During this time, all internal clocks are running at their default divide-down frequency of CLKIN. The CPU clock (SYSCLK1) is running at CLKIN frequency. The peripheral clock (SYSCLK2) is running at CLKIN frequency divide-by-2. The EMIF internal clock source (SYSCLK3) is running at CLKIN frequency divide-by-2. SYSCLK3 is reflected on the ECLKOUT pin (when EKSRC bit = 0 [default]). CLKOUT3 is running at CLKIN frequency divide-by-8.

| 14  | $t_h(HRDYL-HSTBL)$   | Hold time, $\overline{HSTROBE}$ low after $\overline{HRDY}$ low. $\overline{HSTROBE}$ should not be inactivated until $\overline{HRDY}$ is active (low); otherwise, HPI writes will not complete properly. | 2          |     | 2                            |     | ns   |
| 18  | $t_{su}(HASL-HSTBL)$ | Setup time, $\overline{HAS}$ low before $\overline{HSTROBE}$ low                                                                                                                                           | 2          |     | 2                            |     | ns   |
| 19  | $t_h(HSTBL-HASL)$    | Hold time, $\overline{HAS}$ low after $\overline{HSTROBE}$ low                                                                                                                                             | 2          |     | 2                            |     | ns   |

<sup>†</sup>  $\overline{HSTROBE}$  refers to the following logical operation on  $\overline{HCS}$ ,  $\overline{HDS1}$ , and  $\overline{HDS2}$ :  $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$ .

<sup>‡</sup>  $P = 1/\text{CPU clock frequency}$  in ns. For example, when running parts at 250 MHz, use  $P = 4$  ns.

<sup>§</sup> Make sure the external host meets the timing specifications of the C6711 device. Delays or buffers may be needed to compensate for any timing differences. IBIS analysis should be used to correctly model the system interface.

<sup>¶</sup> Select signals include:  $\overline{HCNTL}[1:0]$ ,  $\overline{HR}/\overline{W}$ , and  $\overline{HHWIL}$ .

| 15  | $t_{d(HSTBH-HDZH)}$ Delay time, $\overline{HSTROBE}$ high to HD high impedance                     | 3          | 15  | 3              | 13  | 3          | 12  | ns   |
| 16  | $t_{d(HSTBL-HDV)}$ Delay time, $\overline{HSTROBE}$ low to HD valid                                | 3          | 15  | 3              | 13  | 3          | 12  | ns   |
| 17  | $t_{d(HSTBH-HRDYH)}$ Delay time, $\overline{HSTROBE}$ high to $\overline{HRDY}$ high <sup>  </sup> | 3          | 15  | 3              | 13  | 3          | 12  | ns   |

<sup>†</sup>  $\overline{HSTROBE}$  refers to the following logical operation on  $\overline{HCS}$ ,  $\overline{HDS1}$ , and  $\overline{HDS2}$ :  $[\text{NOT}(\overline{HDS1} \text{ XOR } \overline{HDS2})] \text{ OR } \overline{HCS}$ .

<sup>‡</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>§</sup>  $\overline{HCS}$  enables  $\overline{HRDY}$ , and  $\overline{HRDY}$  is always low when  $\overline{HCS}$  is high. The case where  $\overline{HRDY}$  goes high when  $\overline{HCS}$  falls indicates that HPI is busy completing a previous HPID write or READ with autoincrement.

<sup>††</sup> Make sure the external host meets the timing specifications of the C6711 device. Delays or buffers may be needed to compensate for any timing differences. IBIS analysis should be used to correctly model the system interface.

<sup>#</sup> This parameter is used during an HPID read. At the beginning of the first half-word transfer on the falling edge of  $\overline{HSTROBE}$ , the HPI sends the request to the EDMA internal address generation hardware, and  $\overline{HRDY}$  remains high until the EDMA internal address generation hardware loads the requested data into HPID.

<sup>||</sup> This parameter is used after the second half-word of an HPID write or autoincrement read.  $\overline{HRDY}$  remains low if the access is not an HPID write or autoincrement read. Reading or writing to HPIC or HPIC does not affect the  $\overline{HRDY}$  signal.

|     |                    |                                               | CLKX ext                                   | 1                    |      |
| 11  | $t_{h(CKXL-FXH)}$  | Hold time, external FSX high after CLKX low   | CLKX int                                   | 6                    | ns   |
|     |                    |                                               | CLKX ext                                   | 3                    |      |

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>§</sup> The minimum CLKR/X period is twice the CPU cycle time (2P). This means that the maximum bit rate for communications between the McBSP and other device is 75 Mbps for 150 MHz CPU clock or 50 Mbps for 100 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 150 MHz (P = 6.7 ns), use 33 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

|     |                    |                                               | CLKR ext   | 4                                   |      |
| 10  | $t_{su(FXH-CKXL)}$ | Setup time, external FSX high before CLKX low | CLKX int   | 9                                   | ns   |
|     |                    |                                               | CLKX ext   | 1                                   |      |
| 11  | $t_{h(CKXL-FXH)}$  | Hold time, external FSX high after CLKX low   | CLKX int   | 6                                   | ns   |
|     |                    |                                               | CLKX ext   | 3                                   |      |

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>§</sup> The minimum CLKR/X period is twice the CPU cycle time (2P) and not faster than 75 Mbps (13.3 ns). This means that the maximum bit rate for communications between the McBSP and other devices is 75 Mbps for 167-MHz and 200-MHz CPU clocks or 50 Mbps for 100-MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 67 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 15 ns (67 MHz), whichever value is larger. For example, when running parts at 167 MHz (P = 6 ns), use 15 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>¶</sup> This parameter applies to the maximum McBSP frequency. Operate serial clocks (CLKR/X) in the reasonable range of 40/60 duty cycle.

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> Minimum delay times also represent minimum output hold times.

<sup>§</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>¶</sup> The minimum CLKR/X period is twice the CPU cycle time (2P). This means that the maximum bit rate for communications between the McBSP and other device is 75 Mbps for 150 MHz CPU clock or 50 Mbps for 100 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 150 MHz (P = 6.7 ns), use 33 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>#</sup> C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even  
= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even  
= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see <sup>¶</sup> footnote above).

<sup>||</sup> Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

If DXENA = 0, then D1 = D2 = 0

If DXENA = 1, then D1 = 2P, D2 = 4P

|     |                      | ONLY applies when in data delay 0 (XDATDLY = 00b) mode                             | FSX ext                                    | 3    9                                     |      |

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> Minimum delay times also represent minimum output hold times.

<sup>§</sup>  $P = 1/\text{CPU clock frequency}$  in ns. For example, when running parts at 150 MHz, use  $P = 6.7$  ns.

<sup>¶</sup> The minimum CLKR/X period is twice the CPU cycle time ( $2P$ ). This means that the maximum bit rate for communications between the McBSP and other device is 75 Mbps for 150 MHz CPU clock or 50 Mbps for 100 MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 33 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time ( $2P$ ), or 30 ns (33 MHz), whichever value is larger. For example, when running parts at 150 MHz ( $P = 6.7$  ns), use 33 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz ( $P = 16.67$  ns), use  $2P = 33$  ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>#</sup> C = H or L

S = sample rate generator input clock =  $2P$  if CLKSM = 1 ( $P = 1/\text{CPU clock frequency}$ )

= sample rate generator input clock =  $P_{\text{clks}}$  if CLKSM = 0 ( $P_{\text{clks}} = \text{CLKS period}$ )

H = CLKX high pulse width =  $(\text{CLKGDV}/2 + 1) * S$  if CLKGDV is even

=  $(\text{CLKGDV} + 1)/2 * S$  if CLKGDV is odd or zero

L = CLKX low pulse width =  $(\text{CLKGDV}/2) * S$  if CLKGDV is even

=  $(\text{CLKGDV} + 1)/2 * S$  if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see <sup>¶</sup> footnote above).

<sup>||</sup> Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

If DXENA = 0, then  $D1 = D2 = 0$

If DXENA = 1, then  $D1 = 2P$ ,  $D2 = 4P$

|     |                              | ONLY applies when in data delay 0 (XDATDLY = 00b) mode                             | FSX ext                               | 2                       | 9                                     | 2                       | 11.5                 |    |

<sup>†</sup> CLKRP = CLKXP = FSRP = FSXP = 0. If polarity of any of the signals is inverted, then the timing references of that signal are also inverted.

<sup>‡</sup> Minimum delay times also represent minimum output hold times.

<sup>§</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 200 MHz, use P = 5 ns.

<sup>¶</sup> The minimum CLKR/X period is twice the CPU cycle time (2P) and not faster than 75 Mbps (13.3 ns). This means that the maximum bit rate for communications between the McBSP and other devices is 75 Mbps for 167-MHz and 200-MHz CPU clocks or 50 Mbps for 100-MHz CPU clock; where the McBSP is either the master or the slave. Care must be taken to ensure that the AC timings specified in this data sheet are met. The maximum bit rate for McBSP-to-McBSP communications is 67 Mbps; therefore, the minimum CLKR/X clock cycle is either twice the CPU cycle time (2P), or 15 ns (67 MHz), whichever value is larger. For example, when running parts at 167 MHz (P = 6 ns), use 15 ns as the minimum CLKR/X clock cycle (by setting the appropriate CLKGDV ratio or external clock source). When running parts at 60 MHz (P = 16.67 ns), use 2P = 33 ns (30 MHz) as the minimum CLKR/X clock cycle. The maximum bit rate for McBSP-to-McBSP communications applies when the serial port is a master of the clock and frame syncs (with CLKR connected to CLKX, FSR connected to FSX, CLKXM = FSXM = 1, and CLKRM = FSRM = 0) in data delay 1 or 2 mode (R/XDATDLY = 01b or 10b) and the other device the McBSP communicates to is a slave.

<sup>#</sup> C = H or L

S = sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

CLKGDV should be set appropriately to ensure the McBSP bit rate does not exceed the maximum limit (see <sup>¶</sup> footnote above).

<sup>||</sup> Extra delay from CLKX high to DX valid applies *only* to the first data bit of a device, if and only if DXENA = 1 in SPCR.

If DXENA = 0, then D1 = D2 = 0

If DXENA = 1, then D1 = 2P, D2 = 4P

| 7   | t <sub>dis</sub> (FXH-DXHZ)  | Disable time, DX high impedance following last data bit from FSX high |                        |       | 2P + 1.5 | 6P + 17  |                                    |       | 2P + 3 | 6P + 17  | ns   |
| 8   | t <sub>d</sub> (FXL-DXV)     | Delay time, FSX low to DX valid                                       |                        |       | 4P + 2   | 8P + 17  |                                    |       | 4P + 2 | 8P + 17  | ns   |

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>‡</sup> For all SPI slave modes, CLKG is programmed as 1/2 of the CPU clock by setting CLKSM = CLKGDV = 1.

<sup>§</sup> S = Sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= Sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKX period)

T = CLKX period = (1 + CLKGDV) \* S

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even

= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

<sup>¶</sup> FSRP = FSXP = 1. As a SPI master, FSX is inverted to provide active-low slave-enable output. As a slave, the active-low signal input on FSX and FSR is inverted before being used internally.

CLKXM = FSXM = 1, CLKRM = FSRM = 0 for master McBSP

CLKXM = CLKRM = FSXM = FSRM = 0 for slave McBSP

<sup>#</sup> FSX should be low before the rising edge of clock to enable slave devices and then begin a SPI transfer at the rising edge of the master clock (CLKX).

<sup>‡</sup> For all SPI slave modes, CLKG is programmed as 1/2 of the CPU clock by setting CLKSM = CLKGDV = 1.

<sup>§</sup> S = Sample rate generator input clock = 2P if CLKSM = 1 (P = 1/CPU clock frequency)

= Sample rate generator input clock = P\_clks if CLKSM = 0 (P\_clks = CLKS period)

T = CLKX period = (1 + CLKGDV) \* S

H = CLKX high pulse width = (CLKGDV/2 + 1) \* S if CLKGDV is even  
= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

L = CLKX low pulse width = (CLKGDV/2) \* S if CLKGDV is even  
= (CLKGDV + 1)/2 \* S if CLKGDV is odd or zero

<sup>¶</sup> FSRP = FSXP = 1. As a SPI master, FSX is inverted to provide active-low slave-enable output. As a slave, the active-low signal input on FSX and FSR is inverted before being used internally.

CLKXM = FSXM = 1, CLKRM = FSRM = 0 for master McBSP

CLKXM = CLKRM = FSXM = FSRM = 0 for slave McBSP

<sup>#</sup> FSX should be low before the rising edge of clock to enable slave devices and then begin a SPI transfer at the rising edge of the master clock (CLKX).

Figure 56. Timer Timing

**GENERAL-PURPOSE INPUT/OUTPUT (GPIO) PORT TIMING [C6711C/C6711D ONLY]**

**timing requirements for GPIO inputs<sup>†‡</sup> (see Figure 57)**

| NO. |                                         | GDPA-167<br>-200<br>-250 (6711D) |     | UNIT |
|-----|-----------------------------------------|----------------------------------|-----|------|
|     |                                         | MIN                              | MAX |      |
| 1   | $t_{w(GPIH)}$ Pulse duration, GPIx high | 4P                               |     | ns   |
| 2   | $t_{w(GPIL)}$ Pulse duration, GPIx low  | 4P                               |     | ns   |

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>‡</sup> The pulse width given is sufficient to generate a CPU interrupt or an EDMA event. However, if a user wants to have the DSP recognize the GPIx changes through software polling of the GPIO register, the GPIx duration must be extended to at least 24P to allow the DSP enough time to access the GPIO register through the CFGBUS.

**switching characteristics over recommended operating conditions for GPIO outputs<sup>†§</sup> (see Figure 57)**

| NO. | PARAMETER                               | GDPA-167<br>-200<br>-250 (6711D) |     | UNIT |
|-----|-----------------------------------------|----------------------------------|-----|------|
|     |                                         | MIN                              | MAX |      |
| 3   | $t_{w(GPOH)}$ Pulse duration, GPOx high | 12P – 3                          |     | ns   |
| 4   | $t_{w(GPOL)}$ Pulse duration, GPOx low  | 12P – 3                          |     | ns   |

<sup>†</sup> P = 1/CPU clock frequency in ns. For example, when running parts at 250 MHz, use P = 4 ns.

<sup>§</sup> The number of CFGBUS cycles between two back-to-back CFGBUS writes to the GPIO register is 12 SYSCLK1 cycles; therefore, the minimum GPOx pulse width is 12P.

SPRS088L – FEBRUARY 1999 – REVISED MAY 2004

## REVISION HISTORY

This data sheet revision history highlights the technical changes made to the SPRS088J device-specific data sheet to make it an SPRS088K revision. It also contains the technical changes made to the SPRS088K device-specific data sheet to make in an SPRS088L revision (notated by **[SPRS088L]**).

**Scope:** Applicable updates to the C67x device family, specifically relating to the C6711/11B and C6711C/11D devices, have been incorporated.

| PAGE(S)<br>NO. | ADDITIONS/CHANGES/DELETIONS                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 71–124         | Updated all MIN MAX column headers to incorporate the new 250 MHz (GDP) clock speed. The update adds either GDP-250 or 11DGDP-250 to the MIN MAX column header.                                                                                                                                                                                                                                                                                                                         |
| 92–124         | Changed the P note to read "... For example, when running parts at 250 MHz, use P = 4 ns."                                                                                                                                                                                                                                                                                                                                                                                              |
| 1              | Updated the Excellent–Price/Performance Floating-Point Digital Signal Processors (DSPs) bullet to reflect the new 250-MHz (GDP) part.<br>Added 4 to the Instruction Cycle Time bullet.<br>Added 1500 to the MFLOPS bullet.<br>Added bullet for 3.3-V I/O, 1.4-V Internal (C6711D–250).<br>Updated the bullet for 3.3-V I/O, (C6711C/C6711D) to 1.20-V Internal. <b>[SPRS088L]</b>                                                                                                       |
| 4              | Updated the third paragraph to include MFLOPS information for the new 6711D 250-MHz part.                                                                                                                                                                                                                                                                                                                                                                                               |
| 5              | Updated Table 1, Characteristics of the C6711/C6711B and C6711C/C6711D Processors, to show the new Frequency, Cycle Time, and Voltage for GDP – 250 MHz.<br>Updated Table 1, Voltage row, to show the 6711C/6711D voltage as 1.20 rather than 1.26-V. <b>[SPRS088L]</b>                                                                                                                                                                                                                 |
| 6              | Updated the third bullet to show the C6711C/C6711D voltage as 1.20V. <b>[SPRS088L]</b><br>Added a footnote stating that the value is compatible with existing 1.26V designs. <b>[SPRS088L]</b>                                                                                                                                                                                                                                                                                          |
| 31             | Updated the CVDD supply-voltage for C6711C/C6711D to 1.20V. <b>[SPRS088L]</b><br>Added a footnote to the table stating that the new 1.20V value is compatible with existing 1.26 designs. <b>[SPRS088L]</b>                                                                                                                                                                                                                                                                             |
| 32             | Updated the CVDD supply-voltage for C6711C/C6711D to 1.20V. <b>[SPRS088L]</b><br>Added a footnote to the table stating that the new 1.20V value is compatible with existing 1.26V designs. <b>[SPRS088L]</b>                                                                                                                                                                                                                                                                            |
| 37             | Updated Table 18, TMS320C6711/C6711B/C6711C/C6711D Device Part Numbers (P/Ns) and Ordering Information, to show the new part number TMS320C6711DGDP250.<br>Changed the CDVV (core voltage) to 1.20V from 1.26V for the following part numbers: <b>[SPRS088L]</b><br>TMS320C6711CGDP200<br>TMS32C6711CGDPA167<br>TMS320C6711DGDP200<br>TMS32C6711DGDPA167<br>Added a footnote to the table stating that the new 1.20V value is compatible with existing 1.26V designs. <b>[SPRS088L]</b> |
| 58             | Updated paragraphs one and two (found below Figure 14).                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| 65             | recommended operating conditions<br>Updated the core supply voltage listings for the GDP packages (MIN, NOM, and MAX).<br>Updated the C6711C/C6711D core supply voltage listing for C6711C/C6711D MIN to 1.14, and NOM to 1.2. <b>[SPRS088L]</b><br>Added footnote specifying that the new MIN and NOM values are compatible with existing 1.26V designs. <b>[SPRS088L]</b>                                                                                                             |
| 67             | electrical characteristics over recommended ranges of supply voltage and operating case temperature <sup>†</sup> (unless otherwise noted) for C6711C/C6711D only table<br>Added Core Supply Current row for the C6711D 250 MHz device.                                                                                                                                                                                                                                                  |

| 71             | INPUT AND OUTPUT CLOCKS<br>Created a <b>timing requirements for CLKIN for C6711DGD-250</b> table.                                                                                                                                                       |
| 76             | switching characteristics over recommended operating conditions for asynchronous memory cycles table:<br>Updated parameter description for No. 9; added "and EDx invalid."<br>Removed "... and for writes, include ED[__:0] from end of third footnote. |
| 94             | switching characteristics over recommended operating conditions during reset table<br>Split out NO. 3 into 3a and 3b, and NO. 5 into 5a and 5b.<br>3a and 5a show the parameter for C6711C.<br>3b and 5b show the parameter for C6711D.                 |
| 95             | Figure 44 , Reset Timing<br>Split out ECLKOUT into 6711C ECLKOUT and 6711D ECLKOUT, and CLKOUT2 into 6711C CLKOUT2 and 6711D CLKOUT2.<br>Removed the footnote that described the states of ECLKOUT and CLKOUT2 for C6711C and C6711D.                   |

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
