- ES6011 circuits are designed to meet the DC specifications shown in the above table after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse airflow > 500 LFPM is maintained.
- Output termination voltage $V_{TT} = 0$ V for $V_{CC} = 2.5$ V operation is supported but the power consumption of the device will increase.
- V_{PP} (DC) is the minimum differential input voltage swing required to maintain device functionality.
- V_{CMR} (DC) is the crosspoint of the differential input signal. Functional operation is obtained when the crosspoint is within the V_{CMR} (DC) range and the input swing lies within the V_{PP} (DC) specification.
