

Built-in BBEII Audio sound controller

BD3860K

BD3860K can reproduce clear sound in high band and distinct sound in low band by integrating BBEII function. If this IC is used for car stereo, sound can be reproduced distinctly without turning up the volume.

●Applications

Car audio, Mini component, Micro component.

●Features

- 1) Built-in BBEII circuit, 4-input selector (4ch stereo), input gain, main volume, loudness, tone (2 band), fader volume.
- 2) BBEII circuit is profitable for S/N because of no process control in no signal.
- 3) Bi-CMOS process is suitable for the design of low current and energy saving. It provides more quality for small scale regulator and heat in a set.
- 4) Q factor, center frequency f_0 , and gain G of bass can be controlled by external parts. These functions can be used as super bass filter.
- 5) Can be controlled by power supply of 3.3V or 5V.
- 6) Easy to design signal level diagram by laying BBEII, and tone circuit through main volume.
- 7) Easy layout of the board by laying each pin of audio input (total 8pin), and audio output (total 4pin) together.

●Absolute maximum ratings (Ta=25°C)

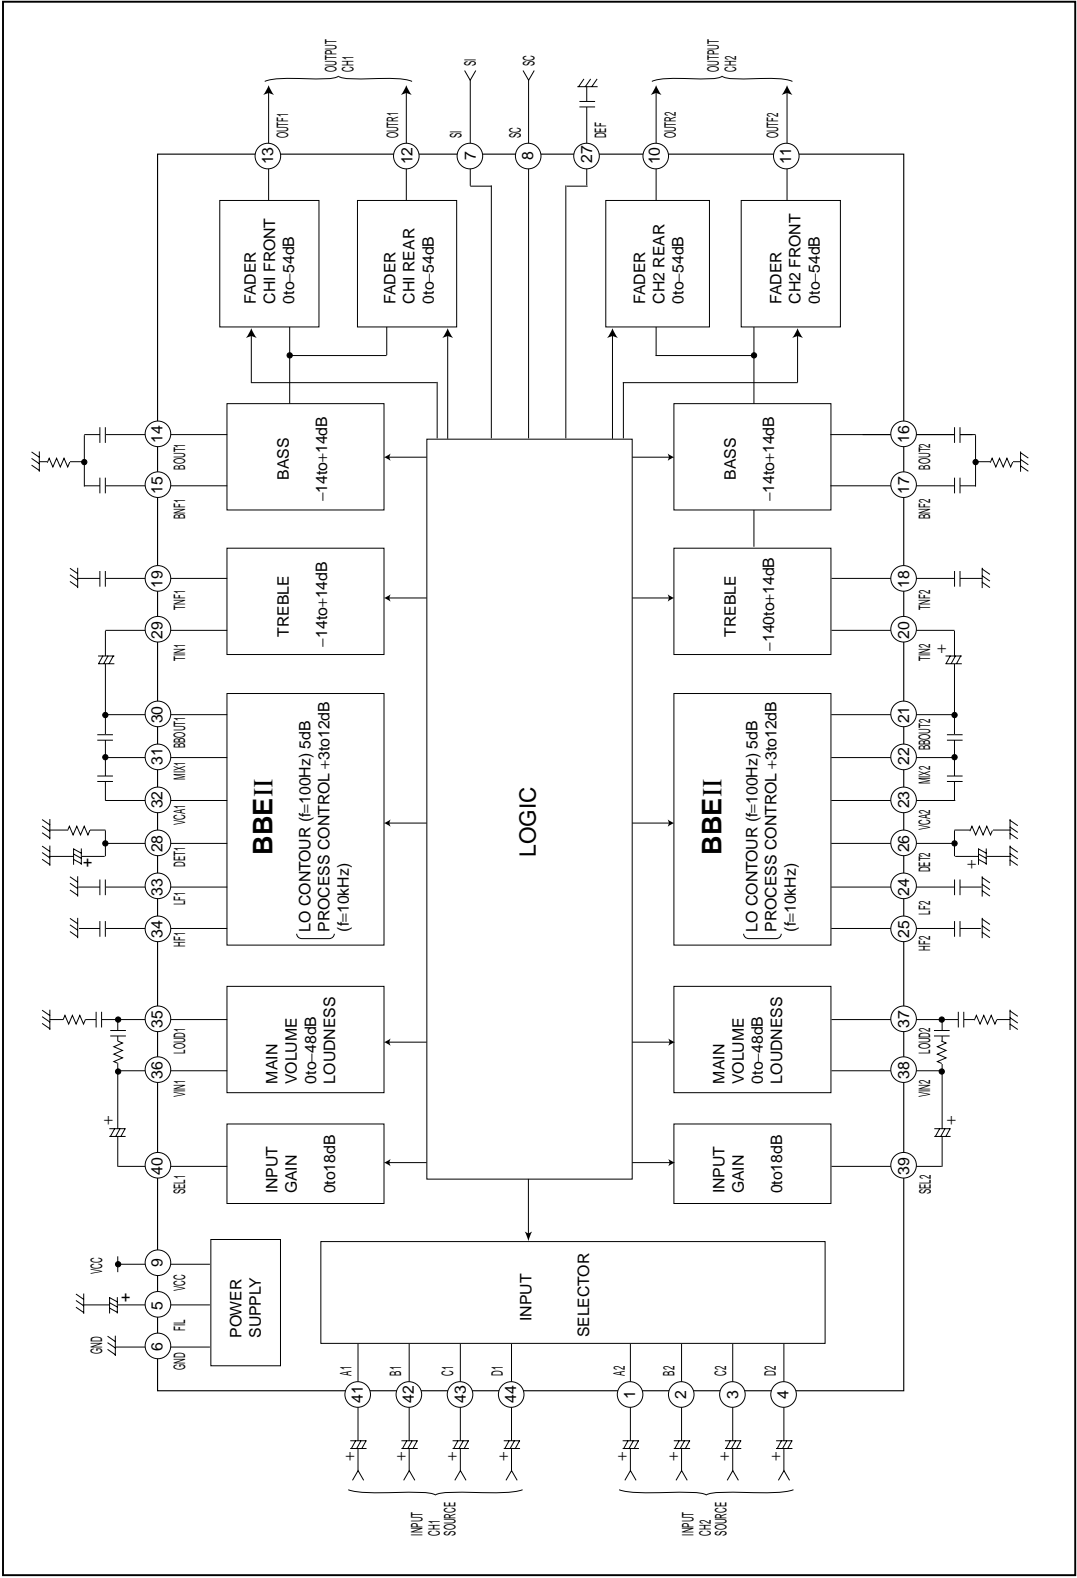

| Parameter | Symbol | Limits | Unit |
|-----------------------|------------------|----------|------|
| Power supply voltage | V _{CC} | 10 | V |
| Power dissipation | P _d | 850* | mW |
| Operating temperature | T _{opr} | -40~+85 | °C |
| Storage temperature | T _{stg} | -55~+125 | °C |

*Reduced by 8.5mW for each increase in Ta of 1°C over 25°C.

●Recommended operating conditions (Ta=25°C)

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|----------------------|-----------------|------|------|------|------|
| Power supply voltage | V _{CC} | 7.0 | — | 9.5 | V |

●Pin equivalent circuit and description

| Pin No. | Pin name | Pin voltage | Equivalent circuit | Pin description |
|--|--|-------------|---|---|
| 41 42 43 44 1 2 3 4 | A1 B1 C1 D1 A2 B2 C2 D2 | 4.5V |  | A pin for inputting a sound signal. It is suitable for input of CD, MD, tuner and tape. Connect this pin to a front stage circuit through a coupling capacitor. |
| 40 39 | SEL1 SEL2 | 4.5V |  | A pin for outputting a sound signal, which has been selected by an input selector and amplified by input gain. Connect this pin to a rear stage circuit through a coupling capacitor between the VIN1 and VIN2 pins. |
| 36 38 | VIN1 VIN2 | 4.5V |  | A pin for inputting a sound signal to main volume. The input impedance is 60kΩ (upon typical setting). Connect this pin to a front stage circuit through a coupling capacitor between the SEL1 and SEL2 pins circuit. |
| 35 37 | LOUD1 LOUD2 | 4.5V |  | A pin for setting the loudness frequency characteristics and gain. |

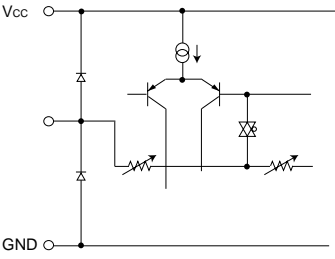

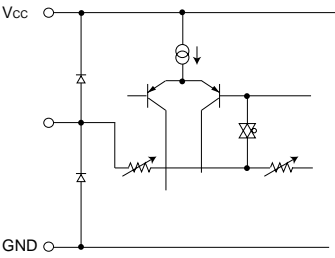

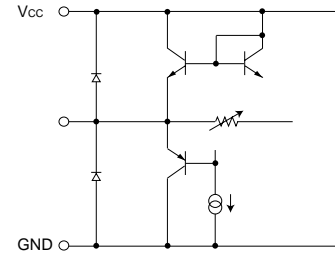

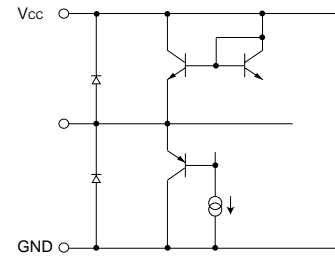

Audio ICs

| Pin No. | Pin name | Pin voltage | Equivalent circuit | Pin description |
|----------|--------------|-------------|--------------------|--|
| 33 24 | LF1 LF2 | 4.5V | | A pin for setting the low pass frequency of BBE II. |
| 34 25 | HF1 HF2 | 4.5V | | A pin for setting the high pass frequency of BBE II. |
| 32 23 | VCA1 VCA2 | 4.5V | | A pin for outputting the high pass VCA of BBE II. Connect the HPF capacitor between the MIX1 and MIX2 pins |
| 31 22 | MIX1 MIX2 | 4.5V | | A pin for inverse input for output MIX amplifier of BBE II. Connect the HPF capacitor between the VCA1 and VCA2 pins, and the LPF capacitor between the BBOUT1 and BBOUT2 pins. |

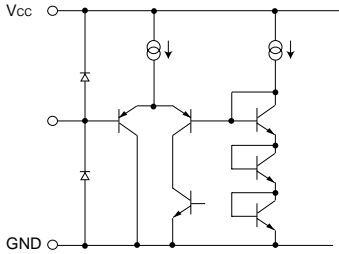

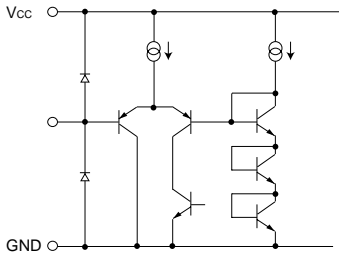

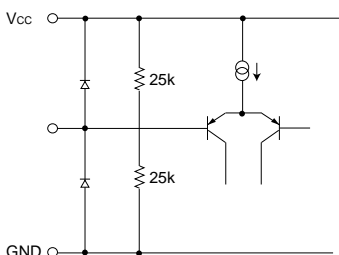

Audio ICs

| Pin No. | Pin name | Pin voltage | Equivalent circuit | Pin description |
|----------|------------------|-------------|--------------------|---|
| 30 21 | BBOUT1 BBOUT2 | 4.5V | | <p>A pin for outputting the BBE II signal.</p> <p>Connect the LPF capacitor between the MIX1 and MIX2 pins and connect this pin to a rear stage circuit through a coupling capacitor between the TIN1 and TIN2 pins.</p> |
| 29 20 | TIN1 TIN2 | 4.5V | | <p>A pin for inputting a sound signal to Treble.</p> <p>The input impedance is 47kΩ (upon typical setting).</p> <p>Connect this pin to a front circuit through a coupling capacitor between the BBOUT1 and BBOUT2 pins.</p> |
| 28 26 | DET1 DET2 | — | | <p>A pin for time constant of high pass boost detector of BBE II .</p> <p>Attack/Recovery time depends on the external capacitor and resistance.</p> |
| 27 | DEF | — | | <p>A pin for ON/OFF switching time constant of BBE II .</p> <p>Timing constant "T" depends on the external capacitor "C" and internal resistance "R" (upon typical setting).</p> <p>$T=CR$ (sec)</p> |

Audio ICs

| Pin No. | Pin name | Pin voltage | Equivalent circuit | Pin description |
|----------------------|----------------------------------|-------------|---|---|
| 19 18 | TNF1 TNF2 | 4.5V |  | A pin for setting Treble frequency characteristic. |
| 15 17 | BNF1 BNF2 | 4.5V |  | A pin for setting Bass frequency characteristic and gain. |
| 14 16 | BOUT1 BOUT2 | 4.5V |  | A pin for setting Bass frequency and gain. |
| 13 12 11 10 | OUTF1 OUTR1 OUTF2 OUTR2 | 4.5V |  | A pin for outputting a sound signal. Connect this pin to a rear stage circuit through a coupling capacitor. |

Audio ICs

| Pin No. | Pin name | Pin voltage | Equivalent circuit | Pin description |
|---------|----------|-------------|---|--|
| 8 | SC | — |  | A pin for inputting a serial data. |
| 7 | SI | — |  | A pin for inputting a serial clock. |
| 5 | FIL | 4.5V |  | 1/2 VCC. Voltage for power supply of signal system. |
| 9 | VCC | 9V | — | Power supply pin. |
| 6 | GND | 0V | — | A ground pin. |

VP-9690A (Average value detection, effective value display) IHF-A filter by Matsushita Communication is used for * measurement.

Operation spec : Phase between input / output is same.

Design against radiation-proof is not mode.

● Measurement circuit

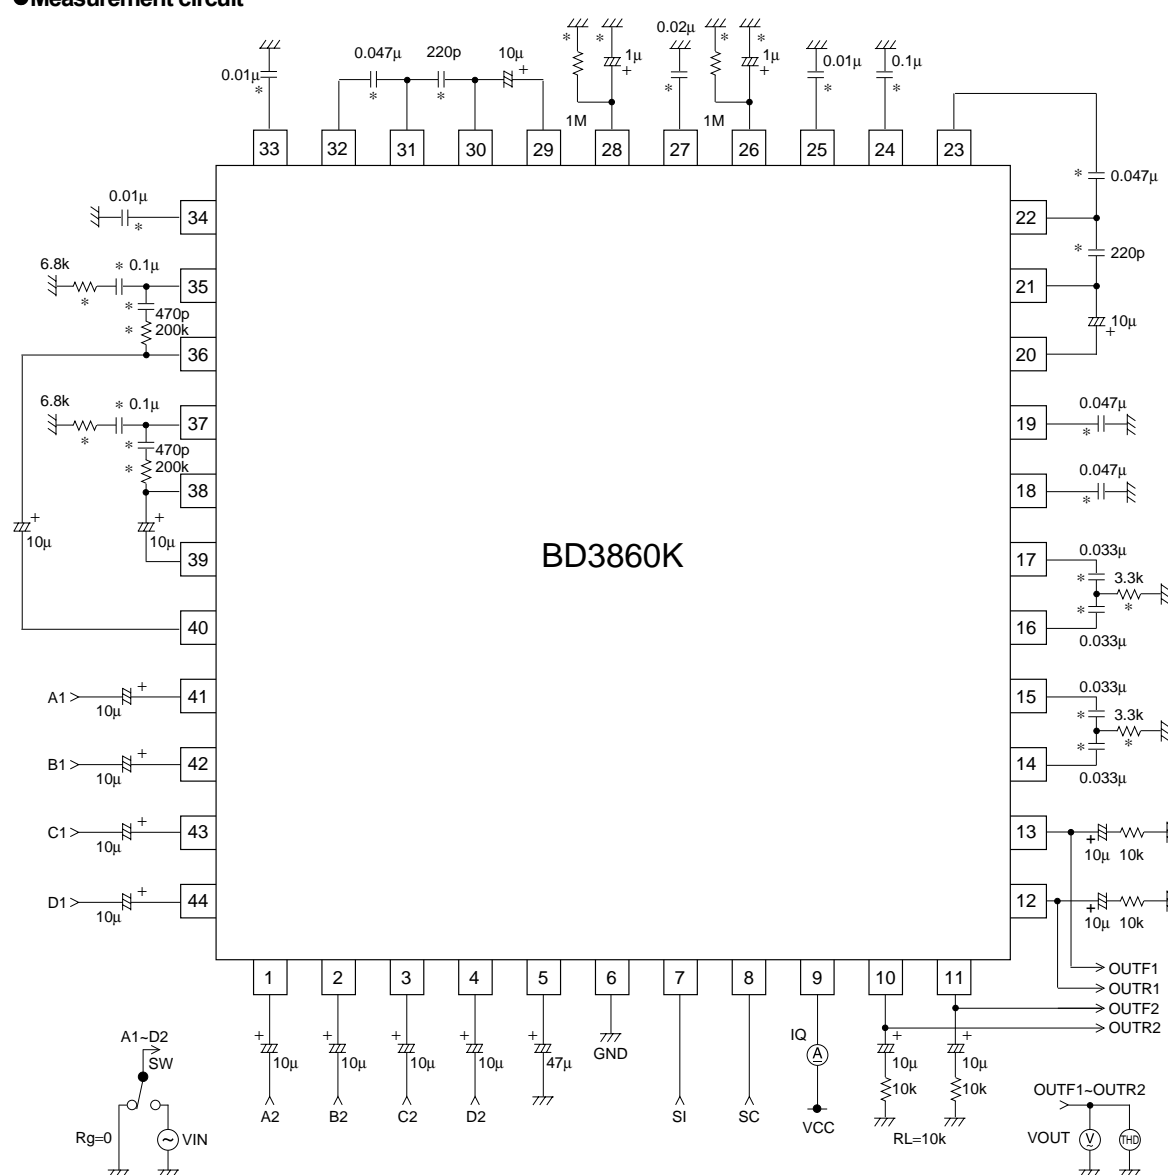

Fig.1 MEASUREMENT CIRCUIT DIAGRAM

Recommendable external parts

1. Element marked with *

- Carbon-film resistor : $\pm 1\%$
- Film capacitor : $\pm 1\%$
- Ceramic capacitor : $\pm 1\%$

2. Unless specified particularly, use the following external parts:

- Carbon-film resistor : $\pm 5\%$
- Film capacitor : $\pm 20\%$
- Electrolytic capacitor : $\pm 20\%$

Notes on wiring

1. GND shall be wired solidly.
2. Wiring patten of SI and SC shall be away from that of analog unit and crosstalk shall not be acceptable.
3. Lines of SI and SC of shall not be parallel if possible. The lines shall be shielded, if they are adjacent to each other.

Audio ICs

●Circuit operations

Specifications for control signal

(1) Timing of control signal

- Data is read at a leading edge of clock.
- Latch is read at a trailing edge of clock.
- Be sure to set SI to LOW after latching.

Fig.2

Constant of timing chart (Ta=25°C, Vcc=9V)

| Parameter | Symbol | Min. | Typ. | Max. | Unit |
|------------------------|--------|------|------|------|------|
| "High" input voltage | VIH | 2.6 | – | 5.5 | V |
| "Low" input voltage | VIL | 0 | – | 1.1 | V |
| Clock width | Twc | 2.0 | – | – | μs |
| Data width | twd | 2.0 | – | – | μs |
| Latch width | tw1 | 2.0 | – | – | μs |
| "Low" hold width | Twh | 2.0 | – | – | μs |
| Setup time (DATA→CLK) | Tsd | 1.0 | – | – | μs |

Constant set up tone loudness filter

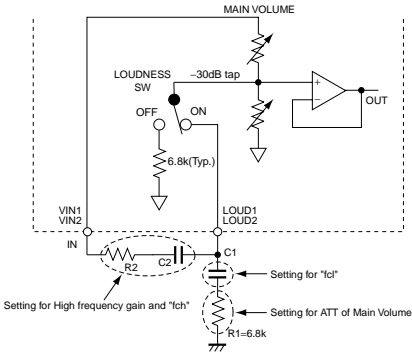

Fig.9

Fig.10

Audio ICs

The resistance R1 is used to set for attenuation of main volume at loudness ON. The resistance R1 should be the same $6.8\text{k}\Omega$ with inside resistance $6.8\text{k}\Omega$ (Typ.) of main volume -30dB tap at loudness OFF. Except this value, the attenuation of main volume at loudness ON is wrong. In the low frequency fully less than "fcl", the voltage gain is fixed on 14dB (Typ.) by inside constant at attenuation -30dB of main volume. The resistance R2 and the capacitor C2 are used to set for the characteristic in high frequency range. The voltage gain in high frequency range can be changed by the value of R2 like the upper figure.

BBEII explanation of operation

BBEII is a system. This processor treats a loudspeaker and amplifier as an integrated sound system and it exactly reproduces the "rising edge of sound", which characterizes the sound, though appropriate signal processing at a front stage of amplifier input. This mechanism generates the playback sound almost like natural sound.

(1) Problem of sound playback in sound playback system

In the nature world, treble harmonics are produced first usually and then basic low-frequency wave is generated. This is the same with an attacking part which characterizes various kinds of sounds of musical instruments. The character of sound is expressed by the frequency upon rising edge of sound and the amplitude which forms an envelope. Therefore, it is very important to express the rising edge of natural sound exactly upon reproducing the sound through sound playback system. In the sound playback system of today, however, an unavoidable mismatch is made between a loudspeaker and amplifier.

A transistor power amplifier operates as a constant voltage source because of negative feedback technology, while a loudspeaker is a current device. Therefore, an unavoidable mismatch is made in the system. Moreover, the impedance characteristic of loudspeaker varies considerably depending on electric reactance of voice coil or mechanical reactance of cone assembly. As a result, the rising edge of sound is distorted and a phase of playback sound is deflected. Furthermore, increased treble impedance reduces the loudspeaker amplitude and harmonics. Therefore, treble constituent is easy to be masked by subsequent high-level middle range constituent and the rising edge of sound becomes hard to be reproduced so exactly.

Audio ICs

(2) Principle of operation

BBEII processes the signals to solve the above-mentioned problem of sound playback system as follows:

Phase correction

Fig. 12

By dividing the input signal into three frequency bands, the bass (20Hz to 150Hz), middle range (150Hz to 2.4kHz) and by combining them, the phase difference 180° is made between the bass and middle range and 360° between the bass and treble.

Time delay characteristic in every frequency is adjusted through such phase difference and, therefore, the distortion of rising edge of sound can be minimized.

Amplitude correction (Harmonic correction)

High-speed detector and high-performance VCA circuit controls the amplitude of treble constituent to keep appropriate audibility balance at the treble which consists of harmonics. Correction value is decided by both operations at two kinds of levels; one level is set up by serial control from an outside source and another one is obtained by detecting an input signal. The amplitude of treble input into VCA is corrected by an internal control signal obtained through such operations. By this amplitude correction, the harmonics is recovered and the definition level of musical instrument or voice can be enhanced.

Bass boost

The bass constituent is boosted to keep well balance to the treble constituent varying dynamically.

The boost is fixed to 5dB (Typ.) at $f=100\text{Hz}$ by an internal circuit and it cannot be controlled externally.

Audio ICs

(3) Explanation of external constant

Characteristic of high frequency filter

Frequency characteristic at a maximum process control level is shown in the under-mentioned chart:

Fig. 13

As shown in the above-mentioned chart, the cut-off frequency of treble constituent is decided by the external capacitors C1 and C2. The frequency characteristic marked with a dotted line varies depending on this value. Balance of harmonics changes and, therefore, it is an important parameter to decide the sound tone.

Fig.14 BBEII gain-frequency (reference) characteristics

Controls the amplitude of treble by input signal level

The attack and release time of controls the amplitude of treble can be decided by outside constant.

The pins are DET1 (Pin 28) and DET2 (Pin 26). The method of setting is the lower figure.

The input signal level started to control the amplitude of treble is fixed on about -40dBV (Typ.) by inside circuit. Therefore, it cannot be change from outside pin.

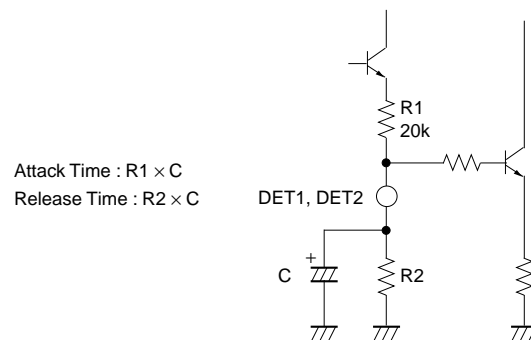

Fig. 15

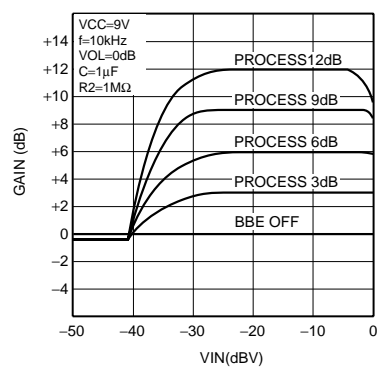

Fig.16 Process control-input voltage (reference) characteristics

Time constant at switching ON/OFF

At switching ON/OFF, this IC is used to switching of time constant, for measuring against DC offset. The pin for setting is DEF (Pin 27). The method of setting is the lower figure.

Fig.17

● Operation notes

- Within operation voltage supply range, basic circuit function operation is guaranteed within operation ambient temp. But please confirm set up of constant and element, voltage set up and temp set up on use.

- If it within recommended operation voltage range, circuit function operation is guaranteed within operation temp.
It corralled to conditions of power dissipation to temp.

Please watch out except condition stipulated by electrical characteristics within the range, It cannot guarantee standard value of electrical characteristics. But it retains original function.

Audio ICs

3. About Application circuit

Example of application circuit drawing is convinced as recommendable, but please confirm characteristic including above mentioned noticed. At use with modification of external constant, please decide with enough margin considering distribution, ETC of this IC, external parts including quiescence characteristics and excessive characteristics. Please note that we have not yet confirmed any concerned patent rights completely.

4. About power on reset

At on of supply voltage circuit made initialization inside IC is built-in. To be concrete, setting is made so that the following table. Please send data to all address as initial data at supply voltage on. And please supply mute at set side until this initial data is sent.

| Function | Initial condition |
|----------------|-------------------|
| Input selector | INA |
| Input gain | 0dB |
| Loudness | OFF |
| Main volume | $-\infty$ dB |
| Bass gain | 0dB |
| Treble gain | 0dB |
| BBE II | OFF |
| Fader volume | $-\infty$ dB |

5. About 2-wire serial control

High-frequency digital signal is inputted into the SC terminal and SI terminal. So wire and print patterns suitably to prevent interference to analog signal system line.

6. About muting

When the attenuation of main volume is changed from -48 dB to $-\infty$ dB, it maybe occur pop noise caused by DC offset. Therefor, to prevent it, please mute by fader volume first of all, and then mute by main volume.

Conversely, when the muting is released, please by main volume first of all, and then release by fader volume.

7. About the license of BBE Sound Inc.

This IC is manufactured according to the license of BBE Sound Inc. Upon using it, the license agreement with BBE Sound Inc. is required.

8. About setting of main volume in using BBEII

Controls the amplitude of treble of BBEII are motioned by detecting the signal level after main volume. Therefor, when the signal is attenuated less than about -40 dBV (Typ.) in main volume, controls the amplitude of treble cannot be motioned. To attenuation that dose not spoil the controls the amplitude of treble, please use fader volume.

When BBE is ON, please use all flat of tone and loudness. And when you use other processor (SRS/Spatializer/Q-Sound etc.), please plan that BBE places in later in later position. When you use Dolby-Surround or Dolby-ProLogic, it is no problem that BBE places in first position to reduce numbers of channels. But if you cannot apply to Dolby lab. For permission, BBE places in later position.

The drawing shows the mechanical specifications for the QFP44 package. The top view includes dimensions for the overall square body (14.0 ± 0.3 mm), the pin pitch (1.00 ± 0.2 mm), and the distance from the body center to the pin center (10.0 ± 0.2 mm). Pin numbers 1, 11, 22, and 33 are indicated. The side view shows the package height (2.15 ± 0.1 mm) and the maximum standoff height (0.05 mm). A detail view of a pin shows a diameter of 0.35 ± 0.1 mm and a thickness of 0.15 mm.
