

The SP5511 is a single-chip frequency synthesiser designed for TV tuning systems. Control data is entered in the standard I<sup>2</sup>C BUS format. In 18-lead plastic DIL package, the SP5511 has three addressable current-limited output ports (P0-P3) and four bi-directional output ports (P0-P2) and four addressable bi-directional open-collector ports (P4-P7) of which P6 is also a 3-bit 5-level ADC input. The information on these ports can be read via the I<sup>2</sup>C BUS. The SP5511S is a variant in a 16-lead miniature plastic package, without P0-P2 but functionally identical in other respects to the SP5511.

The device has four programmable I<sup>2</sup>C BUS addresses, allowing two or more synthesisers to be used in a system.

### FEATURES

- Complete 1.3GHz Single Chip System
- Programmable via the I<sup>2</sup>C BUS
- Low Power Consumption (240mW Typ.)
- Low Radiation
- Phase Lock Detector
- Varactor Drive Amp Disable
- 7 Controllable Outputs, 4 Bi-directional (SP5511)
- 4 Bi-directional Controllable Outputs (SP5511S)
- 5-Level ADC
- Variable I<sup>2</sup>C BUS Address for Picture in Picture TV
- ESD Protection \*

\* Normal ESD handling precautions should be observed.

### APPLICATIONS

- Cable Tuning Systems
- VCRs

### ORDERING INFORMATION

**SP5511 NA DP** (18-lead plastic package)

**SP5511S NA MP** (16-lead miniature plastic package)

## SP5511

### ELECTRICAL CHARACTERISTICS

$T_{AMB} = -10^{\circ}\text{C}$  to  $+80^{\circ}\text{C}$ ,  $V_{CC} = +4.5\text{V}$  to  $+5.5\text{V}$ . All pin references are to the SP5511 (DP18 package). These Characteristics are guaranteed by either production test or design. They apply within the specified ambient temperature and supply voltage ranges unless otherwise stated. Reference frequency 4MHz unless otherwise stated.

Characteristic	Pin	Value			Units	Conditions
		Min.	Typ.	Max.		
Supply current	14		48	60	mA	V <sub>CC</sub> = 5V 80MHz to 1GHz 1·3GHz, see Fig. 5
Prescaler input voltage	15,16	12·5 30		300 300	mVrms mVrms	
Prescaler input impedance	15,16		50		Ω	
Prescaler input capacitance			2		pF	
<b>SDA, SCL</b>						
Input high voltage	4,5	3		5·5	V	Input voltage = V <sub>CC</sub> Input voltage = 0V When V <sub>CC</sub> = 0V
Input low voltage	4,5	0		1·5	V	
Input high current	4,5			10	μA	
Input low current	4,5			−10	μA	
Leakage current	4,5			10	μA

Power consumption at 5.5V				363	mW	

Fig. 2 Block diagram. (Ports P0-P2 not present on SP5511S)

## FUNCTIONAL DESCRIPTION

The SP5511 is programmed from an I<sup>2</sup>C BUS. Data and Clock are fed in on the SDA and SCL lines respectively as defined by the I<sup>2</sup>C Bus format. The synthesiser can either accept new data (write mode) or send data (read mode). The Tables in Fig. 3 illustrate the format of the data. The device can be programmed to respond to several addresses, which enables the use of more than one synthesiser in an I<sup>2</sup>C BUS system. Table 4 shows how the address is selected by applying a voltage to P3. The address input circuit is shown in Fig.6. The LSB of the address Byte (R/W) sets the device into read mode if it is high and write mode if it is low. When the SP5511 receives a correct address Byte it pulls the SDA line low during the acknowledge period and during following acknowledge periods after further data Bytes are programmed. When the SP5511 is programmed into the read mode the controlling device accepting the data must pull down the SDA line during the following acknowledge period to read another status Byte.

### WRITE MODE (FREQUENCY SYNTHESIS)

When the device is in the write mode Bytes 2+3 select the synthesised frequency while Bytes 4+5 select the output port states and charge pump information.

Once the correct address is received and acknowledged, the first Bit of the next Byte determines whether that Byte is interpreted as Byte 2 or 4, a logic 0 for frequency information and a logic 1 for charge pump and output port information. Additional data Bytes can be entered without the need to re-address the device until an I<sup>2</sup>C stop condition is recognised. This allows a smooth frequency sweep for fine tuning or AFC purposes.

If the transmission of data is stopped mid-byte (i.e., by another device on the bus) then the previously programmed byte is maintained.

Frequency data from Bytes 2 and 3 is stored in a 15-bit shift register and is used to control the division ratio of the 15-bit programmable divider which is preceded by a divide-by-8 prescaler and amplifier to give excellent sensitivity at the local oscillator input; see Fig 5. The input impedance is shown in Figs. 7 and 8.

The programmed frequency can be calculated by multiplying the programmed division ratio by 8 times the comparison frequency  $F_{COMP}$ .

When frequency data is entered, the phase comparator, via the charge pump and varactor drive amplifier, adjusts the

local oscillator control voltage until the output of the programmable divider is frequency and phase locked to the comparison frequency.

The reference frequency may be generated by an external source capacitively coupled into pin 2 or provided by an on-chip 4MHz crystal controlled oscillator.

Note that the comparison frequency is 7.8125kHz when a 4MHz reference is used.

Bit 2 of Byte 4 of the programming data (CP) controls the current in the charge pump circuit, a logic 1 for  $\pm 170\mu A$  and a logic 0 for  $\pm 50\mu A$ , allowing compensation for the variable tuning slope of the tuner and also to enable fast channel changes over the full band. Bit 4 of Byte 4 (T0) disables the charge pump if set to a logic 1. Bit 8 of Byte 4 (OS) switches the charge pump drive amplifier's output off when it is set to a logic 1. Bit 3 of Byte 4 (T1) selects a test mode where the phase comparator inputs are available on P6 and P7, a logic 1 connects  $F_{COMP}$  to P6 and  $F_{DIV}$  to P7.

Byte 5 programs the output ports P0-P7, a logic 0 for a high impedance output, logic 1 for low impedance (on).

### READ MODE

When the device is in the read mode the status data read from the device on the SDA line takes the form shown in Table 2.

Bit 1 (POR) is the power on reset indicator and is set to a logic 1 if the power supply to the device has dropped below a nominal 3V and the programmed information lost (e.g., when the device is initially turned on). The POR is set to 0 when the read sequence is terminated by a stop command. The outputs are all set to high impedance when the device is initially powered up. Bit 2 (FL) indicates whether the device is phase locked, a logic 1 is present if the device is locked and a logic 0 if the device is unlocked.

Bits 3, 4 and 5 (I2, I1, I0) show the status of the I/O Ports P7, P5 and P4 respectively. A logic 0 indicates a low level and a logic 1 a high level. If the ports are to be used as inputs they should be programmed to a high impedance state (logic 1). These inputs will then respond to data complying with standard TTL voltage levels. Bits 6, 7 and 8 (A2, A1, A0) combine to give the output of the 5-level ADC.

The 5-level ADC can be used to feed AFC information to the microprocessor from the IF section of the television, as illustrated in Fig. 4.

## NOTE

† Programmed by connecting a 15kΩ resistor between pin 10 and V<sub>CC</sub>

\* Don't care condition on SP5511S.

Fig. 3 Data formats

## APPLICATION

The graph shows the relationship between input voltage ( $V_{IN}$ ) and frequency. The y-axis is labeled  $V_{IN}$  (mV RMS INTO 50  $\Omega$ ) and ranges from 0 to 300. The x-axis is labeled FREQUENCY (MHz) and ranges from 0 to 1500. A shaded gray region represents the 'OPERATING WINDOW', which is bounded by  $V_{IN} = 12.5$  mV from 80 MHz to 1000 MHz,  $V_{IN} = 300$  mV from 80 MHz to 1300 MHz, and a diagonal line from (1000, 12.5) to (1300, 300). A solid black curve starts at approximately (80, 100), dips to a minimum of about 5 mV at 250 MHz, and then rises to about 15 mV at 1700 MHz. Dashed vertical lines are at 80 MHz and 1300 MHz.
