## TYPICAL APPLICATION CIRCUIT

Low Dropout Linear Regulator

## DESCRIPTION

The AIC1737 is a 3-pin low dropout linear regulator. The superior characteristics of the AIC1737 include zero base current loss, very low dropout voltage, and 2% accuracy output voltage. Typical ground current remains approximately 55 μA, from no load to maximum loading conditions. Dropout voltage is exceptionally low. Output current limiting and thermal limiting are built in to provide maximal protection to the AIC1737 against fault conditions.

The AIC1737 comes in the popular 3-pin SOT-89 packages.

- Note 1: Guaranteed by design.
- Note 2: Regulation is measured at constant junction temperature, using pulse testing with a low ON time.
- Note 3: Current limit is measured by pulsing a short time.
- Note 4: Dropout voltage is defined as the input to output differential at which the output voltage drops 100mV below the value measured with a 1V differential.

### APPLICATION INFORMATIONS

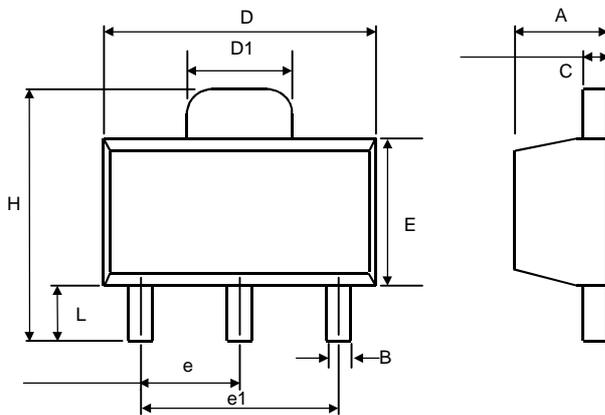

A 1 $\mu$ F (or greater) capacitor is required between the AIC1737 output and ground for stability. Without this capacitor the part will oscillate. Even though most types of capacitor may work, the equivalent series resistance (ESR) should be held to 5 $\Omega$  or less if Aluminum electrolytic type is used. Many Aluminum electrolytics have electrolytes that freeze at about -30 $^{\circ}$ C, so solid tantalums are recommended for

operation below -25 $^{\circ}$ C. The value of this capacitor may be increased without limit.

A 0.1 $\mu$ F capacitor (or greater) should be placed from the AIC1737 input to ground if the lead inductance between the input and power source exceeds 500nH (approximately 10 inches of trace).
