512Kx36 & 1Mx18-Bit Synchronous Pipelined Burst SRAM

FEATURES

- Synchronous Operation.
- 2 Stage Pipelined operation with 4 Burst.
- On-Chip Address Counter.
- Self-Timed Write Cycle.
- On-Chip Address and Control Registers.
- $V_{DD} = 2.5$ or $3.3V \pm 5\%$ Power Supply.
- 5V Tolerant Inputs Except I/O Pins.
- Byte Writable Function.
- Global Write Enable Controls a full bus-width write.
- Power Down State via ZZ Signal.
- LBO Pin allows a choice of either a interleaved burst or a linear burst.
- Three Chip Enables for simple depth expansion with No Data Contention ; 2cycle Enable, 2cycle Disable.
- Asynchronous Output Enable Control.
- ADSP, ADSC, ADV Burst Control Pins.
- TTL-Level Three-State Output.
- 100-TQFP-1420A Package (Lead and Lead free package)
- Operating in commercial and industrial temperature range.

GENERAL DESCRIPTION

The K7A163631B and K7A161831B are 18,874,368-bit Synchronous Static Random Access Memory designed for high performance second level cache of Pentium and Power PC based System.

It is organized as 512K(1M) words of 36(18) bits and integrates address and control registers, a 2-bit burst address counter and added some new functions for high performance cache RAM applications; $\overline{GW}$, $\overline{BW}$, $\overline{LBO}$, ZZ. Write cycles are internally self-timed and synchronous.

Full bus-width write is done by $\overline{GW}$, and each byte write is performed by the combination of $\overline{WEx}$ and $\overline{BW}$ when $\overline{GW}$ is high. And with $\overline{CS1}$ high, $\overline{ADSP}$ is blocked to control signals.

Burst cycle can be initiated with either the address status processor(ADSP) or address status cache controller(ADSC) inputs. Subsequent burst addresses are generated internally in the system's burst sequence and are controlled by the burst address advance(ADV) input.

$\overline{LBO}$ pin is DC operated and determines burst sequence(linear or interleaved).

ZZ pin controls Power Down State and reduces Stand-by current regardless of CLK.

The K7A163631B and K7A161831B are fabricated using SAMSUNG's high performance CMOS technology and is available in a 100pin TQFP package. Multiple power and ground pins are utilized to minimize ground bounce.

FUNCTION DESCRIPTION

The K7A163631B and K7A161831B are synchronous SRAM designed to support the burst address accessing sequence of the Power PC based microprocessor. All inputs (with the exception of $\overline{OE}$, $\overline{LBO}$ and $\overline{ZZ}$) are sampled on rising clock edges. The start and duration of the burst access is controlled by $\overline{ADSC}$, $\overline{ADSP}$ and $\overline{ADV}$ and chip select pins.

The accesses are enabled with the chip select signals and output enabled signals. Wait states are inserted into the access with $\overline{ADV}$. When $\overline{ZZ}$ is pulled high, the SRAM will enter a Power Down State. At this time, internal state of the SRAM is preserved. When $\overline{ZZ}$ returns to low, the SRAM normally operates after 2cycles of wake up time. $\overline{ZZ}$ pin is pulled down internally.

Read cycles are initiated with $\overline{ADSP}$ (regardless of $\overline{WEx}$ and $\overline{ADSC}$) using the new external address clocked into the on-chip address register whenever $\overline{ADSP}$ is sampled low, the chip selects are sampled active, and the output buffer is enabled with $\overline{OE}$. In read operation the data of cell array accessed by the current address, registered in the Data-out registers by the positive edge of CLK, are carried to the Data-out buffer by the next positive edge of CLK. The data, registered in the Data-out buffer, are projected to the output pins. $\overline{ADV}$ is ignored on the clock edge that samples $\overline{ADSP}$ asserted, but is sampled on the subsequent clock edges. The address increases internally for the next access of the burst when $\overline{WEx}$ are sampled High and $\overline{ADV}$ is sampled low. And $\overline{ADSP}$ is blocked to control signals by disabling $\overline{CS1}$.

All byte write is done by $\overline{GW}$ (regardless of $\overline{BW}$ and $\overline{WEx}$), and each byte write is performed by the combination of $\overline{BW}$ and $\overline{WEx}$ when $\overline{GW}$ is high.

Write cycles are performed by disabling the output buffers with $\overline{OE}$ and asserting $\overline{WEx}$. $\overline{WEx}$ are ignored on the clock edge that samples $\overline{ADSP}$ low, but are sampled on the subsequent clock edges. The output buffers are disabled when $\overline{WEx}$ are sampled Low(regardless of $\overline{OE}$). Data is clocked into the data input register when $\overline{WEx}$ sampled Low. The address increases internally to the next address of burst, if both $\overline{WEx}$ and $\overline{ADV}$ are sampled Low. Individual byte write cycles are performed by any one or more byte write enable signals($\overline{WEa}$, $\overline{WEb}$, $\overline{WEc}$ or $\overline{WEd}$) sampled low. The $\overline{WEa}$ control DQa0 ~ DQa7 and DQPa, $\overline{WEb}$ controls DQb0 ~ DQb7 and DQPb, $\overline{WEc}$ controls DQc0 ~ DQc7 and DQPc, and $\overline{WEd}$ control DQd0 ~ DQd7 and DQPd. Read or write cycle may also be initiated with $\overline{ADSC}$, instead of $\overline{ADSP}$. The differences between cycles initiated with $\overline{ADSC}$ and $\overline{ADSP}$ as are follows;

$\overline{ADSP}$ must be sampled high when $\overline{ADSC}$ is sampled low to initiate a cycle with $\overline{ADSC}$.

$\overline{WEx}$ are sampled on the same clock edge that sampled $\overline{ADSC}$ low(and $\overline{ADSP}$ high).

Addresses are generated for the burst access as shown below, The starting point of the burst sequence is provided by the external address. The burst address counter wraps around to its initial state upon completion. The burst sequence is determined by the state of the $\overline{LBO}$ pin. When this pin is Low, linear burst sequence is selected. When this pin is High, Interleaved burst sequence is selected.

BURST SEQUENCE TABLE

(Interleaved Burst)

$\overline{\text{LBO}}$ PIN	HIGH	Case 1		Case 2		Case 3		Case 4	
		A ₁	A ₀	A ₁	A ₀	A ₁	A ₀	A ₁	A ₀
First Address ↓ Fourth Address		0	0	0	1	1	0	1	1
		0	1	0	0	1	1	1	0
		1	0	1	1	0	0	0	1
		1	1	1	0	0	1	0	0

(Linear Burst)

$\overline{\text{LBO}}$ PIN	LOW	Case 1		Case 2		Case 3		Case 4	
		A ₁	A ₀	A ₁	A ₀	A ₁	A ₀	A ₁	A ₀
First Address ↓ Fourth Address		0	0	0	1	1	0	1	1
		0	1	1	0	1	1	0	0
		1	0	1	1	0	0	0	1
		1	1	0	0	0	1	1	0

Note : 1. $\overline{LBO}$ pin must be tied to High or Low, and Floating State must not be allowed.

ASYNCHRONOUS TRUTH TABLE

OPERATION	$\overline{ZZ}$	$\overline{OE}$	I/O Status
Sleep Mode	H	X	High-Z
Read	L	L	DQ
	L	H	High-Z
Write	L	X	Din, High-Z
Deselected	L	X	High-Z

Notes

1. X means "Don't Care".
2. $\overline{ZZ}$ pin is pulled down internally
3. For write cycles that following read cycles, the output buffers must be disabled with $\overline{OE}$, otherwise data bus contention will occur.
4. Sleep Mode means power down state of which stand-by current does not depend on cycle time.
5. Deselected means power down state of which stand-by current depends on cycle time.

TRUTH TABLES

SYNCHRONOUS TRUTH TABLE

$\overline{CS}_1$	$\overline{CS}_2$	$\overline{CS}_2$	$\overline{ADSP}$	$\overline{ADSC}$	$\overline{ADV}$	$\overline{WRITE}$	CLK	ADDRESS ACCESSED	Operation
H	X	X	X	L	X	X	↑	N/A	Not Selected

INTERLEAVE READ TIMING (Refer to non-interleave write timing for interleave write timing)

(ADSP CONTROLLED, ADSC=HIGH)

100-TQFP-1420A (Lead and Lead free package)

The drawing shows the mechanical specifications of the 24-pin package. The top view includes the following dimensions:

- Overall width: 22.00 ± 0.30
- Pin pitch (width between pins): 0.65
- Pin width: 0.30 ± 0.10
- Maximum pin-to-pin spacing: $\varnothing 0.10 \text{ MAX}$
- Distance from pin #1 to the center of the package: 0.58
- Distance from the center of the package to the edge of the pin array: 14.00 ± 0.20
- Distance from the center of the package to the edge of the pin array (including the package body): 16.00 ± 0.30
- Distance from the center of the package to the edge of the pin array (including the package body and a small offset): 0.83

The side view shows the following dimensions:

- Maximum height of the package: 1.60 MAX
- Height of the package body: 1.40 ± 0.10
- Minimum height of the pin array: 0.05 MIN
- Width of the pin array: 0.50 ± 0.10
