FLASH MEMORY

CMOS

4M (512K × 8) BIT

MBM29F040A-90-X/-12-X

■ FEATURES

- **Single 5.0 V read, write, and erase**
  Minimizes system level power requirements
- **Compatible with JEDEC-standard commands**
  Uses same software commands as E^2PROMs
- **Compatible with JEDEC-standard byte-wide pinouts**
  32-pin PLCC (Package suffix: PD)
  32-pin TSOP (Package suffix: PFTN – Normal Bend Type, PFTR – Reversed Bend Type)
- **Minimum 100,000 write/erase cycles**
- **High performance**
  90 ns maximum access time
- **Sector erase architecture**
  8 equal size sectors of 64 K bytes each
  Any combination of sectors can be concurrently erased. Also supports full chip erase.
- **Embedded Erase™ Algorithms**
  Automatically pre-programs and erases the chip or any sector
- **Embedded Program™ Algorithms**
  Automatically writes and verifies data at specified address
- **$\overline{\text{Data}}$ Polling and Toggle Bit feature for detection of program or erase cycle completion**
- **Low V_{CC} write inhibit ≤3.2 V**
- **Sector protection**
  Hardware method disables any combination of sectors from write or erase operations
- **Erase Suspend/Resume**
  Suspends the erase operation to allow a read data in another sector within the same device
- **Extended operating temperature range: –40°C to +85°C**

■ GENERAL DESCRIPTION

The MBM29F040A-X is a 4 M-bit, 5.0 V-only Flash memory organized as 512 K bytes of 8 bits each. The MBM29F040A-X is offered in a 32-pin PLCC and 32-pin TSOP packages. This device is designed to be programmed in-system with the standard system 5.0 V V_{CC} supply. A 12.0 V V_{PP} is not required for write or erase operations. The device can also be reprogrammed in standard EPROM programmers.

The industrial MBM29F040A-X offers access times of 90 ns and 120 ns, allowing operation of high-speed microprocessors without wait states. To eliminate bus contention the device has separate chip enable ($\overline{CE}$), write enable ($\overline{WE}$), and output enable ($\overline{OE}$) controls.

The MBM29F040A-X is pin and command set compatible with JEDEC standard 4 M-bit E^2PROMs. Commands are written to the command register using standard microprocessor write timings. Register contents serve as input to an internal state-machine which controls the erase and programming circuitry. Write cycles also internally latch addresses and data needed for the programming and erase operations. Reading data out of the device is similar to reading from 12.0 V Flash or EPROM devices.

The MBM29F040A-X is programmed by executing the program command sequence. This will invoke the Embedded Program Algorithm which is an internal algorithm that automatically times the program pulse widths and verifies proper cell margin. Typically, each sector can be programmed and verified in less than 0.5 seconds. Erase is accomplished by executing the erase command sequence. This will invoke the Embedded Erase Algorithm which is an internal algorithm that automatically preprograms the array if it is not already programmed before executing the erase operation. During erase, the device automatically times the erase pulse widths and verifies proper cell margin.

A sector is typically erased and verified in 1.0 second (if already completely preprogrammed).

This device also features a sector erase architecture. The sector mode allows for 64 K byte sectors of memory to be erased and reprogrammed without affecting other sectors. The MBM29F040A-X is erased when shipped from the factory.

The device features single 5.0 V power supply operation for both read and write functions. Internally generated and regulated voltages are provided for the program and erase operations. A low V_{CC} detector automatically inhibits write operations on the loss of power. The end of program or erase is detected by $\overline{Data}$ Polling of DQ_7 or by the Toggle Bit feature on DQ_6. Once the end of a program or erase cycle has been completed, the device internally resets to the read mode.

Fujitsu's Flash technology combines years of EPROM and E^2PROM experience to produce the highest levels of quality, reliability and cost effectiveness. The MBM29F040A-X memory electrically erases the entire chip or all bits within a sector simultaneously via Fowler-Nordhiem tunneling. The bytes are programmed one byte at a time using the EPROM programming mechanism of hot electron injection.

FLEXIBLE SECTOR-ERASE ARCHITECTURE

- 64 K byte per sector
- Individual-sector, multiple-sector, or bulk-erase capability
- Individual or multiple-sector protection is user definable

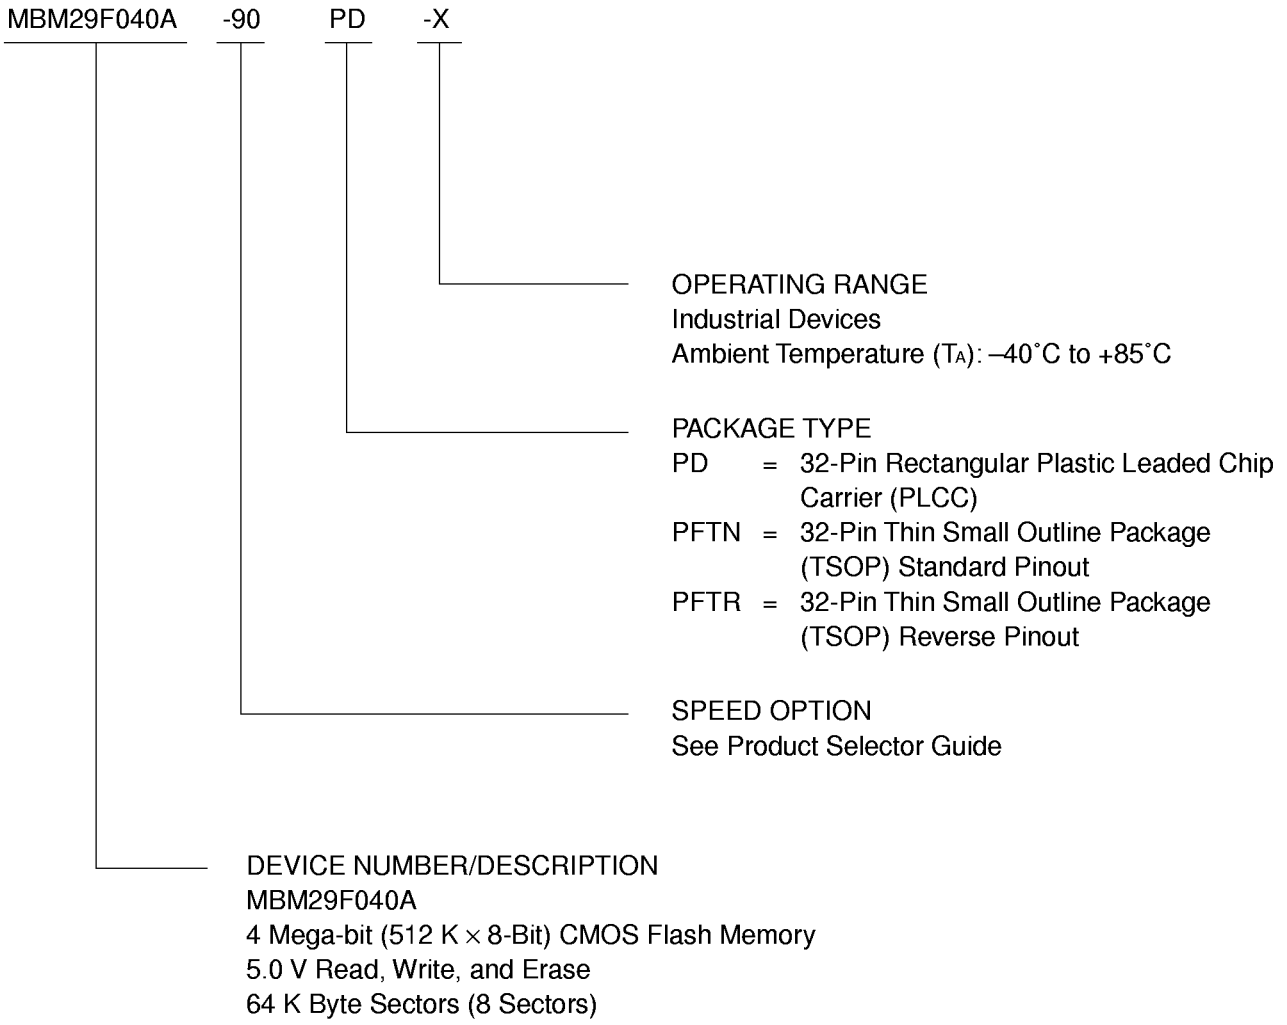
■ ORDERING INFORMATION

Industrial Devices

Fujitsu industrial devices are available in several packages. The order number is formed by a combination of:



■ ABSOLUTE MAXIMUM RATINGS

Storage Temperature	–55°C to +125°C
Ambient Temperature with Power Applied	–40°C to +85°C
Voltage with Respect to Ground All pins except A_9, $\overline{OE}$ (Note 1)	–2.0 V to +7.0 V
V_{CC} (Note 1)	–2.0 V to +7.0 V
A_9, $\overline{OE}$ (Note 2)	–2.0 V to +13.5 V

Notes: 1. Minimum DC voltage on input or I/O pins are –0.5 V. During voltage transitions, inputs may negative overshoot V_{SS} to –2.0 V for periods of up to 20 ns. Maximum DC voltage on output and I/O pins is V_{CC} +0.5 V. During voltage transitions, outputs may positive overshoot to V_{CC} +2.0 V for periods of up to 20 ns.

2. Minimum DC input voltage on A_9, $\overline{OE}$ pins are –0.5 V. During voltage transitions, A_9, and $\overline{OE}$ pins may negative overshoot V_{SS} to –2.0 V for periods of up to 20 ns. Maximum DC input voltage on A_9, and $\overline{OE}$ are +13.5 V which may overshoot to 14.0 V for periods of up to 20 ns.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

■ RECOMMENDED OPERATING RANGES

Industrial Devices

Ambient Temperature (T_A)	–40°C to +85°C
V_{CC} Supply Voltages	+4.50 V to +5.50 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.
