

Precision Voltage Reference

FEATURES

- ◆ Very High Accuracy: +4.5 V Output, ± 0.8 mV
- ◆ Extremely Low Drift: 0.74 ppm/°C (-55°C to +125°C)
- ◆ Excellent Stability: 6 ppm/1000 Hrs. Typical
- ◆ Excellent Line Regulation: 6 ppm/V Typical
- ◆ Wide Supply Range: ± 13.5 to ± 22.0 V
- ◆ Hermetic 14-pin Ceramic DIP
- ◆ Military Processing Options

APPLICATIONS

- ◆ Precision A/D And D/A Converters
- ◆ Transducer Excitation
- ◆ Accurate Comparator Threshold Reference
- ◆ High Resolution Servo Systems
- ◆ Digital Voltmeters
- ◆ High Precision Test and Measurement Instruments

DESCRIPTION

VRE104 Series Precision Voltage References provide ultrastable +4.5 V outputs with up to ± 0.8 mV initial accuracy and temperature coefficient as low as 0.74ppm/°C over the full military temperature range.

These references are specifically designed to be used with the Crystal Semiconductor line of successive-approximation type Analog to Digital Converters (ADCs). This line of ADCs sets new standards for temperature drift, which can only be as good as the external reference used. The VRE104 combined with an ADC will provide the lowest drift data conversion obtainable.

VRE104 series devices are available in two operating temperature ranges, -25°C to +85°C and -55°C to +125°C, and two performance grades. All devices are packaged in 14-pin hermetic ceramic packages for maximum long-term stability. "M" versions are screened for high reliability and quality.

Superior stability, accuracy, and quality make the VRE104 ideal for all precision applications which may require a 4.5 V reference. High-accuracy test and measurement instrumentation, and transducer excitation are some other applications which can benefit from the high accuracy of the VRE104.

Figure 1. BLOCK DIAGRAM

SELECTION GUIDE

Model	Output (V)	Temperature Operating Range	Volt Deviation (MAX)
VRE104C	+4.5	-25°C to +85°C	±0.49mV
VRE104CA	+4.5	-25°C to +85°C	±0.40mV
VRE104M	+4.5	-55°C to +125°C	±0.69mV
VRE104MA	+4.5	-55°C to +125°C	±0.60mV

Hermetic 14-pin Ceramic DIP
Package Style HC

1. CHARACTERISTICS AND SPECIFICATIONS

ELECTRICAL SPECIFICATIONS

$V_{PS} = +15V$, $T = 25^{\circ}C$, $R_L = 10K \Omega$ UNLESS OTHERWISE NOTED.

Grade	VRE104C			VRE104CA			VRE104M			VRE104MA

NOTES:

- * Same as C Models.
- 1. Using the box method, the specified value is the maximum deviation from the output voltage at 25°C over the specified operating temperature range.
- 2. The specified values are unloaded.

3. THEORY OF OPERATION

The following discussion refers to the block diagram in Figure 1. A FET current source is used to bias a 6.3 V zener diode. The zener voltage is divided by the resistor network R1 and R2. This voltage is then applied to the noninverting input of the operational amplifier which amplifies the voltage to produce a 4.5 V output. The gain is determined by the resistor networks R3 and R4: $G = 1 + R4/R3$. The 6.3 V zener diode is used because it is the most stable diode over time and temperature.

The current source provides a closely regulated zener current, which determines the slope of the references' voltage vs. temperature function. By trimming the zener current a lower drift over temperature can be achieved. But since the voltage vs. temperature function is nonlinear, this method leaves a residual error over wide temperature ranges.

To remove this residual error, a nonlinear compensation network of thermistors and resistors has been developed that is used in the VRE104 series references. This proprietary network eliminates most of the nonlinearity in the voltage vs. temperature function. By then adjusting the slope, the VRE104 series produces a very stable voltage over wide temperature ranges. This network is less than 2% of the overall network resistance so it has a negligible effect on long term stability.

4. APPLICATION INFORMATION

The proper connection of the VRE104 series voltage references is shown below with the optional trim resistors. Pay careful attention to the circuit layout to avoid noise pickup and voltage drops in the lines.

The VRE104 series voltage references have the ground terminal brought out on two pins (pin 6 and pin 7) which are connected together internally. This allows the user to achieve greater accuracy when using a socket. Voltage references have a voltage drop across their power supply ground pin due to quiescent current flowing through the contact resistance. If the contact resistance was constant with time and temperature, this voltage drop could be trimmed out. When the reference is plugged into a socket, this source of error can be as high as 20 ppm. By connecting pin 7 to the power supply ground and pin 6 to a high impedance ground point in the measurement circuit, the error due to the contact resistance can be eliminated. If the unit is soldered into place, the contact resistance is sufficiently small that it does not effect performance.
