

64Mbit DDR SDRAM

1M x 16Bit x 4 Banks

Double Data Rate Synchronous DRAM

Revision 1.1

August 2002

Samsung Electronics reserves the right to change products or specification without notice.

Revision History

Revision 1.1 (August 6, 2002)

- Typo corrected

Revision 1.0 (June 17, 2002)

- Defined DC spec

Revision 0.1 (May 20, 2002) - *Target Spec*

- Typo corrected

Revision 0.0 (April 30, 2002) - *Target Spec*

- Defined Target Specification

1M x 16Bit x 4 Banks Double Data Rate Synchronous DRAM with Bi-directional Data Strobe and DLL

FEATURES

- 3.3V $\pm$ 5% power supply for device operation
- 2.5V $\pm$ 5% power supply for I/O interface
- SSTL_2 compatible inputs/outputs
- 4 banks operation
- MRS cycle with address key programs
 - Read latency 3 (clock)
 - Burst length (2, 4 and 8)
 - Burst type (sequential & interleave)
- All inputs except data & DM are sampled at the positive going edge of the system clock
- Differential clock input
- No Write-Interrupted by Read Function
- 2 DQS's (1DQS / Byte)
- Data I/O transactions on both edges of Data strobe
- DLL aligns DQ and DQS transitions with Clock transition
- Edge aligned data & data strobe output
- Center aligned data & data strobe input
- DM for write masking only
- Auto & Self refresh
- 64ms refresh period (4K cycle)
- 66pin TSOP-II
- Maximum clock frequency up to 300MHz
- Maximum data rate up to 600Mbps/pin

ORDERING INFORMATION

Part NO.	Max Freq.	Max Data Rate	Interface	Package
K4D64163HF-TC33	300MHz	600Mbps/pin	SSTL_2	66 pin TSOP-II
K4D64163HF-TC36	275MHz	550Mbps/pin		
K4D64163HF-TC40	250MHz	500Mbps/pin		
K4D64163HF-TC50	200MHz	400Mbps/pin		
K4D64163HF-TC60	166MHz	333Mbps/pin		

GENERAL DESCRIPTION

FOR 1M x 16Bit x 4 Bank DDR SDRAM

The K4D64163H is 67,108,864 bits of hyper synchronous data rate Dynamic RAM organized as 4 x1,048,576 words by 16 bits, fabricated with SAMSUNG's high performance CMOS technology. Synchronous features with Data Strobe allow extremely high performance up to 1.2GB/s/chip. I/O transactions are possible on both edges of the clock cycle. Range of operating frequencies, programmable burst length and programmable latencies allow the device to be useful for a variety of high performance memory system applications.

PIN CONFIGURATION (Top View)

PIN DESCRIPTION

CK, $\overline{\text{CK}}$	Differential Clock Input	BA ₀ , BA ₁	Bank Select Address
CKE	Clock Enable	A ₀ ~ A ₁₁	Address Input
$\overline{\text{CS}}$	Chip Select	DQ ₀ ~ DQ ₁₅	Data Input/Output
$\overline{\text{RAS}}$	Row Address Strobe	V _{DD}	Power
$\overline{\text{CAS}}$	Column Address Strobe	V _{SS}	Ground
WE	Write Enable	V _{DDQ}	Power for DQ's
LDQS, UDQS	Data Strobe	V _{SSQ}	Ground for DQ's
LDM, UDM	Data Mask	NC	No Connection

INPUT/OUTPUT FUNCTIONAL DESCRIPTION

Symbol	Type	Function
CK, $\overline{\text{CK}}^*1$	Input	The differential system clock Input. All of the inputs are sampled on the rising edge of the clock except DQ's and DM's that are sampled on both edges of the DQS.
CKE	Input	Activates the CK signal when high and deactivates the $\overline{\text{CK}}$ signal when low. By deactivating the clock, CKE low indicates the Power down mode or Self refresh mode.
$\overline{\text{CS}}$	Input	$\overline{\text{CS}}$ enables the command decoder when low and disabled the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue.
$\overline{\text{RAS}}$	Input	Latches row addresses on the positive going edge of the CK with $\overline{\text{RAS}}$ low. Enables row access & precharge.
$\overline{\text{CAS}}$	Input	Latches column addresses on the positive going edge of the CK with $\overline{\text{CAS}}$ low. Enables column access.
$\overline{\text{WE}}$	Input	Enables write operation and row precharge. Latches data in starting from $\overline{\text{CAS}}$, $\overline{\text{WE}}$ active.
LDQS,(U)DQS	Input/Output	Data Strobe : Output with read data, input with write data. Edge-aligned with read data, centered in write data. Used to capture write data. For the x16, LDQS corresponds to the data on DQ0-DQ7 ; UDQS corresponds to the data on DQ8-DQ15.
LDM,UDM	Input	Input Data Mask : DM is an input mask signal for write data. Input data is masked when DM is sampled HIGH along with that input data during a WRITE access. DM is sampled on both edges of DQS. DM pins include dummy loading internally, to matches the DQ and DQS loading. For the x16, LDM corresponds to the data on DQ0-DQ7 ; UDM corresponds to the data on DQ8-DQ15.
DQ0 ~ DQ15	Input/Output	Data inputs/Outputs are multiplexed on the same pins.
BA0, BA1	Input	Selects which bank is to be active.
A0 ~ A11	Input	Row/Column addresses are multiplexed on the same pins. Row addresses : RA0 ~ RA11, Column addresses : CA0 ~ CA7.
VDD/VSS	Power Supply	Power and ground for the input buffers and core logic.
VDDQ/VSSQ	Power Supply	Isolated power supply and ground for the output buffers to provide improved noise immunity.
VREF	Power Supply	Reference voltage for inputs, used for SSTL interface.
NC/RFU	No connection/ Reserved for future use	This pin is recommended to be left "No connection" on the device

*1 : The timing reference point for the differential clocking is the cross point of CK and $\overline{\text{CK}}$.

For any applications using the single ended clocking, apply VREF to $\overline{\text{CK}}$ pin.

BLOCK DIAGRAM (1Mbit x 16I/O x 4 Bank)

FUNCTIONAL DESCRIPTION

• Power-Up Sequence

DDR SDRAMs must be powered up and initialized in a predefined manner to prevent undefined operations.

1. Apply power and keep CKE at low state (All other inputs may be undefined)
 - Apply VDD before VDDQ .
 - Apply VDDQ before VREF & VTT
2. Start clock and maintain stable condition for minimum 200us.
3. The minimum of 200us after stable power and clock(CK,CK⁻), apply NOP and take CKE to be high .
4. Issue precharge command for all banks of the device.
5. Issue a EMRS command to enable DLL
- *1 6. Issue a MRS command to reset DLL. The additional 200 clock cycles are required to lock the DLL.
- *1,2 7. Issue precharge command for all banks of the device.
8. Issue at least 2 or more auto-refresh commands.
9. Issue a mode register set command with A8 to low to initialize the mode register.

*1 The additional 200cycles of clock input is required to lock the DLL after enabling DLL.

*2 Sequence of 6&7 is regardless of the order.

MODE REGISTER SET(MRS)

The mode register stores the data for controlling the various operating modes of DDR SDRAM. It programs $\overline{\text{CAS}}$ latency, addressing mode, burst length, test mode, DLL reset and various vendor specific options to make DDR SDRAM useful for variety of different applications. The default value of the mode register is not defined, therefore the mode register must be written after EMRS setting for proper operation. The mode register is written by asserting low on $\overline{\text{CS}}$, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ (The DDR SDRAM should be in active mode with $\overline{\text{CKE}}$ already high prior to writing into the mode register). The state of address pins $\text{A}_0 \sim \text{A}_{11}$ and BA_0, BA_1 in the same cycle as $\overline{\text{CS}}$, $\overline{\text{RAS}}$, $\overline{\text{CAS}}$ and $\overline{\text{WE}}$ going low is written in the mode register. Minimum two clock cycles are requested to complete the write operation in the mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. The mode register is divided into various fields depending on functionality. The burst length uses $\text{A}_0 \sim \text{A}_2$, addressing mode uses A_3 , $\overline{\text{CAS}}$ latency(read latency from column address) uses $\text{A}_4 \sim \text{A}_6$. A_7 is used for test mode. A_8 is used for DLL reset. $\text{A}_7, \text{A}_8, \text{BA}_0$ and BA_1 must be set to low for normal MRS operation. Refer to the table for specific codes for various burst length, addressing modes and $\overline{\text{CAS}}$ latencies.

MRS Cycle

*1 : MRS can be issued only at all banks precharge state.

*2 : Minimum t_{RP} is required to issue MRS command.

EXTENDED MODE REGISTER SET(EMRS)

The extended mode register stores the data for enabling or disabling DLL and selecting output driver strength. The default value of the extended mode register is not defined, therefore the extended mode register must be written after power up for enabling or disabling DLL. The extended mode register is written by asserting low on $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$, $\overline{WE}$ and high on BA0(The DDR SDRAM should be in all bank precharge with CKE already high prior to writing into the extended mode register). The state of address pins A0, A2 ~ A5, A7 ~ A11 and BA1 in the same cycle as $\overline{CS}$, $\overline{RAS}$, $\overline{CAS}$ and $\overline{WE}$ going low are written in the extended mode register. A1 and A6 are used for setting driver strength to normal, weak or matched impedance. Two clock cycles are required to complete the write operation in the extended mode register. The mode register contents can be changed using the same command and clock cycle requirements during operation as long as all banks are in the idle state. A0 is used for DLL enable or disable. "High" on BA0 is used for EMRS. All the other address pins except A0,A1,A6 and BA0 must be set to low for proper EMRS operation. Refer to the table for specific codes.

*1 : RFU(Reserved for future use) should stay "0" during EMRS cycle.

ABSOLUTE MAXIMUM RATINGS

Parameter	Symbol	Value	Unit
Voltage on any pin relative to Vss	V _{IN} , V _{OUT}	-0.5 ~ 3.6	V
Voltage on VDD supply relative to Vss	VDD	-1.0 ~ 3.6	V
Voltage on VDD supply relative to Vss	VDDQ	-0.5 ~ 3.6	V
Storage temperature	T _{STG}	-55 ~ +150	°C
Power dissipation	P _D	1.0	W
Short circuit current	I _{OS}	50	mA

Note : Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded.

Functional operation should be restricted to recommended operating condition.

Exposure to higher than recommended voltage for extended periods of time could affect device reliability.

POWER & DC OPERATING CONDITIONS(SSTL_2 In/Out)

Recommended operating conditions(Voltage referenced to Vss=0V, TA=0 to 65°C)

Parameter	Symbol	Min	Typ	Max	Unit	Note
Device Supply voltage	VDD	3.135	3.3	3.465	V	1
Output Supply voltage	VDDQ	2.375	2.50	2.625	V	1
Reference voltage	VREF	0.49*VDDQ	-	0.51*VDDQ	V	2
Termination voltage	V _{tt}	VREF-0.04	VREF	VREF+0.04	V	3
Input logic high voltage	V _{IH} (DC)	VREF+0.15	-	VDDQ+0.30	V	4
Input logic low voltage	V _{IL} (DC)	-0.30	-	VREF-0.15	V	5
Output logic high voltage	V _{OH}	V _{tt} +0.76	-	-	V	I _{OH} =-15.2mA
Output logic low voltage	V _{OL}	-	-	V _{tt} -0.76	V	I _{OL} =+15.2mA
Input leakage current	I _{IL}	-5	-	5	uA	6
Output leakage current	I _{OL}	-5	-	5	uA	6

Note : 1. Under all conditions VDDQ must be less than or equal to VDD.

2. VREF is expected to equal 0.50*VDDQ of the transmitting device and to track variations in the DC level of the same. Peak to peak noise on the VREF may not exceed + 2% of the DC value. Thus, from 0.50*VDDQ, VREF is allowed + 25mV for DC error and an additional + 25mV for AC noise.

3. V_{tt} of the transmitting device must track VREF of the receiving device.

4. V_{IH}(max.)= VDDQ +1.5V for a pulse width and it can not be greater than 1/3 of the cycle rate.

5. V_{IL}(min.)= -1.5V for a pulse width and it can not be greater than 1/3 of the cycle rate.

6. For any pin under test input of 0V ≤ V_{IN} ≤ VDD is acceptable. For all other pins that are not under test V_{IN}=0V.

DC CHARACTERISTICS

Recommended operating conditions Unless Otherwise Noted, TA=0 to 65°C)

Parameter	Symbol	Test Condition	Version					Unit	Note
			-33	-36	-40	-50	-60		
Operating Current (One Bank Active)	ICC1	Burst Lenth=2 $t_{RC} \geq t_{RC(min)}$ $I_{OL}=0mA$, $t_{CC}= t_{CC(min)}$	210	200	190	170	160	mA	1
Precharge Standby Current in Power-down mode	ICC2P	$CKE \leq V_{IL(max)}$, $t_{CC}= t_{CC(min)}$	5					mA	
Precharge Standby Current in Non Power-down mode	ICC2N	$CKE \geq V_{IH(min)}$, $CS \geq V_{IH(min)}$, $t_{CC}= t_{CC(min)}$	110	105	95	80	70	mA	
Active Standby Current power-down mode	ICC3P	$CKE \leq V_{IL(max)}$, $t_{CC}= t_{CC(min)}$	110	105	95	80	70	mA	
Active Standby Current in in Non Power-down mode	ICC3N	$CKE \geq V_{IH(min)}$, $CS \geq V_{IH(min)}$, $t_{CC}= t_{CC(min)}$	160	150	140	120	100	mA	
Operating Current (Burst Mode)	ICC4	$t_{RC} \geq t_{RFC(min)}$ Page Burst, All Banks activated.	390	370	350	320	300	mA	
Refresh Current	ICC5	$t_{RC} \geq t_{RFC(min)}$	210	200	190	180	170	mA	2
Self Refresh Current	ICC6	$CKE \leq 0.2V$	2					mA	

Note : 1. Measured with outputs open.
2. Refresh period is 64ms.

AC INPUT OPERATING CONDITIONS

Recommended operating conditions(Voltage referenced to VSS=0V, VDD=3.3V± 5%, VDDQ=2.5V± 5%, TA=0 to 65°C)

Parameter	Symbol	Min	Typ	Max	Unit	Note
Input High (Logic 1) Voltage; DQ	V_{IH}	$V_{REF}+0.35$	-	-	V	
Input Low (Logic 0) Voltage; DQ	V_{IL}	-	-	$V_{REF}-0.35$	V	
Clock Input Differential Voltage; CK and $\overline{CK}$	V_{ID}	0.7	-	$V_{DDQ}+0.6$	V	1
Clock Input Crossing Point Voltage; CK and $\overline{CK}$	V_{IX}	$0.5 \cdot V_{DDQ}-0.2$	-	$0.5 \cdot V_{DDQ}+0.2$	V	2

Note : 1. V_{ID} is the magnitude of the difference between the input level on CK and the input level on $\overline{CK}$
2. The value of V_{IX} is expected to equal $0.5 \cdot V_{DDQ}$ of the transmitting device and must track variations in the DC level of the same

AC OPERATING TEST CONDITIONS ($V_{DD}=3.3V\pm5\%$, $T_A=0$ to 65°C)

Parameter	Value	Unit	Note
Input reference voltage for CK(for single ended)	$0.50 \cdot V_{DDQ}$	V	
CK and $\overline{\text{CK}}$ signal maximum peak swing	1.5	V	
CK signal minimum slew rate	1.0	V/ns	
Input Levels(V_{IH}/V_{IL})	$V_{REF}+0.35/V_{REF}-0.35$	V	
Input timing measurement reference level	V_{REF}	V	
Output timing measurement reference level	V_{tt}	V	
Output load condition	See Fig.1		

(Fig. 1) Output Load Circuit

CAPACITANCE ($V_{DD}=3.3V$, $T_A=25^\circ\text{C}$, $f=1\text{MHz}$)

Parameter	Symbol	Min	Max	Unit
Input capacitance(CK, $\overline{\text{CK}}$)	C_{IN1}	1.0	5.0	pF
Input capacitance($A_0\sim A_{11}$, $BA_0\sim BA_{11}$)	C_{IN2}	1.0	4.0	pF
Input capacitance (CKE, CS, RAS, CAS, WE)	C_{IN3}	1.0	4.0	pF
Data & DQS input/output capacitance($DQ_0\sim DQ_{31}$)	C_{OUT}	1.0	6.5	pF
Input capacitance($DM_0 \sim DM_3$)	C_{IN4}	1.0	6.5	pF

DECOUPLING CAPACITANCE GUIDE LINE

Recommended decoupling capacitance added to power line at board.

Parameter	Symbol	Value	Unit
Decoupling Capacitance between V_{DD} and V_{SS}	C_{DC1}	$0.1 + 0.01$	μF
Decoupling Capacitance between V_{DDQ} and V_{SSQ}	C_{DC2}	$0.1 + 0.01$	μF

Note : 1. V_{DD} and V_{DDQ} pins are separated each other.
 All V_{DD} pins are connected in chip. All V_{DDQ} pins are connected in chip.
 2. V_{SS} and V_{SSQ} pins are separated each other
 All V_{SS} pins are connected in chip. All V_{SSQ} pins are connected in chip.

ote 1 :

The JEDEC DDR specification currently defines the output data valid window(tDV) as the time period when the data strobe and all data associated with that data strobe are coincidentally valid.

- The previously used definition of tDV(=0.35tCK) artificially penalizes system timing budgets by assuming the worst case

output valid window even then the clock duty cycle applied to the device is better than 45/55%

A new AC timing term, tQH which stands for data output hold time from DQS is defined to account for clock duty cycle variation and replaces tDV

tQHmin = tHP-X where

. tHP=Minimum half clock period for any given cycle and is defined by clock high or clock low time(tCH,tCL)

. X=A frequency dependent timing allowance account for tDQSQmax
