description

The SN74351 comprises two 8-line-to-1-line data selectors/multiplexers with full decoding on one monolithic chip. Symmetrically switching, complementary decode generators minimize decoder skew during changes at the select inputs and ensure that potentially erroneous effects are minimized at the data outputs. Four data inputs are exclusive to each multiplexer and four are common to both. A common enable input is provided which, when high, causes both outputs to assume the high-impedance (off) state and simultaneously diverts the majority of the input current, which reduces the load significantly on the data input drivers. A low logic level at the enable input activates both outputs so that each will assume the complement of the level of the selected input.
