

GS2905

500mA CMOS LDO Voltage Regulator

Product Description

The GS2905 series is a group of positive voltage output, three-pin regulators, that provide a high current even when the input/output voltage differential is small. Low power consumption and high accuracy is achieved through CMOS and programmable fuse technologies. Output voltage: 1.5V to 6.0V.

The GS2905 consists of a high-precision voltage reference, an error correction circuit, and a current limited output driver. Transient response to load variations has improved in comparison to the existing series.

The GS2905 incorporates both over-temperature and over-current protection. SOT-89 and SOT-223 packages are available.

Features

- Maximum output current: 500mA
- Highly accurate: Output voltage $\pm 1.4\%$ ($\pm 1\%$ for semi-custom products)
- Low power consumption
- Over-Current and Over-temperature Protection
- Small input/output differential: 0.3V at 300mA

Applications

- Wireless Communication Systems
- Battery-Operated Systems
- Portable Computer
- Portable Cameras and Video Recorders
- Voltage Regulator for Microprocessor
- Reference Voltage Sources
- Voltage Regulator for CD-ROM Drivers, LAN Cards and DVD.
- Instrumentation
- Pagers

T_{STG}	Storage temperature Range	-65 to 150	°C
T_{LEAD}	Lead Temperature (Soldering, 10 sec)	300	°C

Note: Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied.

Exposure to Absolute Maximum Ratings conditions for extended periods may affect device reliability.

Typical Performance Characteristics

Typical Applications

Low Dropout Linear Regulator

A 1 μF (or greater) capacitor is required between the GS2905 output and ground for stability. Without this capacitor the part will oscillate. Even though most types of capacitor may work, the equivalent series resistance (ESR) should be held to 5 or less if Aluminum electrolytic type is used. Many Aluminum electrolytic have electrolytes that freeze at about -30°C, so solid tantalums are recommended for operation below -25°C. The value of this capacitor may be increased without limit.

A 0.1 μF capacitor (or greater) should be placed from the GS2905 input to ground if the lead inductance between the input and power source exceeds 500nH (approximately 10 inches of trace).
