

FSP431

■ FEATURES

- Equivalent Full-Range Temperature Coefficient : 30 ppm/°C
- 0.2Ω Typical Output Impedance
- Sink-Current Capability : 1 mA to 100 mA
- Low Output Noise
- Adjustable Output Voltage : Vref to 36 V
- TO92-3L, SOT23-3L Package

■ GENERAL DESCRIPTION

The FSP431 is three-terminal adjustable shunt regulators with specified thermal stability over applicable automotive, commercial, and military temperature ranges. The output voltage can be set to any value between Vref (approximately 2.5 V) and 36 V with two external resistors. These devices have a typical output impedance of 0.2Ω. Active output circuitry provides a very sharp turn-on characteristic, making these devices excellent replacements for Zener diodes in many applications, such as onboard regulation, adjustable power supplies, and switching power supplies.

■ ABSOLUTE MAXIMUM RATINGS (NOTE 1)

Parameter	Rating	Unit
Cathode Voltage, V_{KA} (Note 2)	37	V
Continuous Cathode Current Range, I_{KA}	-100 to 150	mA
Reference Input Current Range	-50 μ A to 10mA	
Operating Temperature	0 to 70	°C
Storage Temperature	-65 to 150	°C

Note 1: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in specifications is not implied and prolonged exposure to extreme conditions may affect device reliability.

Note 2: Voltage values are with respect to the anode terminal unless otherwise noted.

■ RECOMMENDED OPERATING CONDITIONS

Parameter	Rating	Unit
Cathode Voltage, V_{KA}	V_{ref} to 36	V
Cathode Current, I_{KA}	1 to 100	mA
Operating Temperature, T_A	0 to 70	°C

ELECTRICAL CHARACTERISTICS

(T_A=25°C, Unless otherwise noted)

PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNIT
Reference Voltage	V _{REF}	V _{KA} = V _{REF} , I _{KA} = 10mA	2.47	2.495	2.52	V
Deviation of reference voltage over full temperature range (see Figure 1)	V _{I(dev)}	V _{KA} = V _{REF} , I _{KA} = 10mA T _A = full range		4	25	mV
Ratio of change in reference voltage to the change in cathode voltage	ΔV _{REF} /ΔV _{KA}	I _{KA} = 10mA	ΔV _{KA} = 10V- V _{REF}	-4.7	-2.7	mV/V
			ΔV _{KA} = 36V- 10V	-1	-2	
Reference Current	I _{REF}	I _{KA} = 10mA, R1=10kΩ, R2=∞		2	4	μA
Deviation of reference current over full temperature range (see Figure 1)	I _{I(dev)}	I _{KA} = 10mA, R1=10kΩ, R2=∞ T _A = full range		0.8	1.2	μA
Minimum Cathode Current for regulation	I _{MIN}	V _{KA} = V _{REF}		0.4	0.6	mA
Off-state Cathode Current	I _{OFF}	V _{KA} = 36V, V _{REF} = 0		0.1	0.5	mA
Dynamic Impedance (see Figure 1)	Z _{KA}	I _{KA} = 1mA to 100mA, V _{KA} = V _{REF} f ≤ 1kHz		0.2	0.5	Ω

The deviation parameters V_{ref(dev)} and I_{ref(dev)} are defined as the differences between the maximum and minimum values obtained over the recommended temperature range. The average full-range temperature coefficient of the reference voltage, V_{ref}, is defined as:

$$|\alpha_{V_{ref}}| \left(\frac{\text{ppm}}{^{\circ}\text{C}} \right) = \frac{\left(\frac{V_{I(dev)}}{V_{ref} \text{ at } 25^{\circ}\text{C}} \right) \times 10^6}{\Delta T_A}$$

Where :

ΔTA is the recommended operating free-air temperature range of the device.

α Vref can be positive or negative, depending on whether minimum Vref or maximum Vref, respectively, occurs at the lower temperature.

Example : maximum Vref=2.496V at 30°C, minimum Vref=2.492V at 0°C, Vref=2.495V at 25°C,

$$|\alpha_{V_{ref}}| = \frac{\left(\frac{4 \text{ mV}}{2495 \text{ mV}} \right) \times 10^6}{70^{\circ}\text{C}} \approx 23 \text{ ppm}/^{\circ}\text{C}$$

Because minimum Vref occurs at the lower temperature, the coefficient is positive.

Calculating Dynamic Impedance

The dynamic impedance is defined as: $|z_{KA}| = \frac{\Delta V_{KA}}{\Delta I_{KA}}$

When the device is operating with two external resistors, the total dynamic impedance of the circuit is given by:

$$|z'| = \frac{\Delta V}{\Delta I} \approx |z_{KA}| \left(1 + \frac{R1}{R2} \right)$$
