

DS91M125

125 MHz 1:4 M-LVDS Repeater with LVDS Input

General Description

The DS91M125 is a 1:4 M-LVDS repeater designed for driving and distributing clock or data signals to up to four multipoint networks.

M-LVDS (Multipoint LVDS) is a new family of bus interface devices based on LVDS technology specifically designed for multipoint and multidrop cable and backplane applications. It differs from standard LVDS in providing increased drive current to handle double terminations that are required in multipoint applications. Controlled transition times minimize reflections that are common in multipoint configurations due to unterminated stubs.

A single DS91M125 channel is a 1:4 repeater that accepts M-LVDS/LVDS/CML/LVPECL signals and converts them to M-LVDS signal levels. Each output has an associated independent driver enable pin. The DS91M125 input conforms to the LVDS standard.

The DS91M125 has a flow-through pinout for easy PCB layout. It provides a new alternative for high speed multipoint interface applications. It is packaged in a space saving SOIC-16 package.

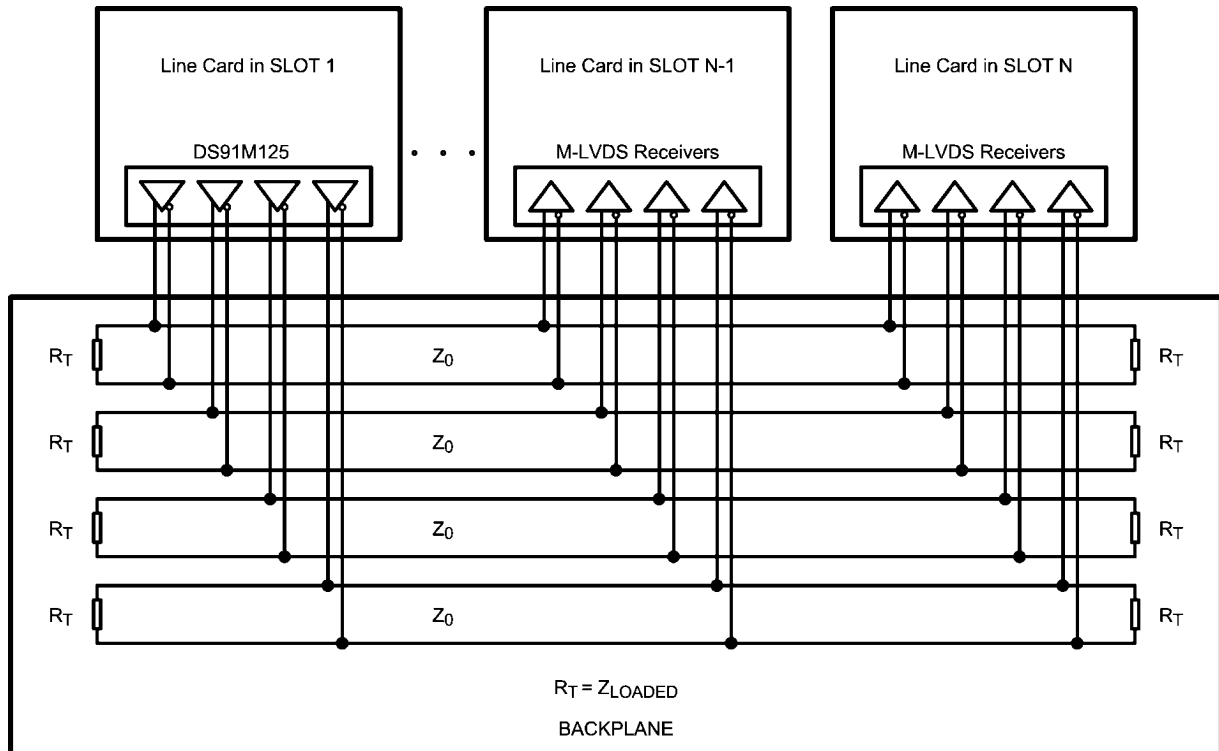

Features

- DC - 125 MHz / 250 Mbps low jitter, low skew, low power operation
- Independent Driver Enable pins
- Outputs Conform to TIA/EIA-899 M-LVDS Standard
- Controlled transition times minimize reflections
- Inputs Conform to TIA/EIA-644-A LVDS Standard
- 8 kV ESD on M-LVDS output pins protects adjoining components
- Flow-through pinout simplifies PCB layout
- Industrial operating temperature range (-40°C to $+85^{\circ}\text{C}$)
- Available in a space saving SOIC-16 package

Applications

- Multidrop / Multipoint clock and data distribution
- High-Speed, Low Power, Short-Reach alternative to TIA/EIA-485/422
- Clock distribution in AdvancedTCA (ATCA) and MicroTCA (μTCA , uTCA) backplanes

Pin Descriptions

Number	Name	I/O, Type	Description
1, 2, 3, 8	DE	I, LVCMOS	Driver enable pins: When DE is low, the driver is disabled. When DE is high, the driver is enabled. There is a 300 kΩ pulldown resistor on each pin.
6	DI+	I, LVDS	Non-inverting receiver input pin.
7	DI-	I, LVDS	Inverting receiver input pin.
5	GND	Power	Ground pin.
10, 11, 14, 15	A	O, M-LVDS	Non-inverting driver output pin.
9, 12, 13, 16	B	O, M-LVDS	Inverting driver output pin.
4	V _{DD}	Power	Power supply pin, +3.3V ± 0.3V

Note 4: "Absolute Maximum Ratings" indicate limits beyond which damage to the device may occur, including inoperability and degradation of device reliability and/or performance. Functional operation of the device and/or non-degradation at the Absolute Maximum Ratings or other conditions beyond those indicated in the Recommended Operating Conditions is not implied. The Recommended Operating Conditions indicate conditions at which the device is functional and the device should not be operated beyond such conditions.

Note 5: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes. Typical specifications are estimations only and are not guaranteed.

Note 6: Current into device pins is defined as positive. Current out of device pins is defined as negative. All voltages are referenced to ground except V_{OD} and ΔV_{OD} .

Note 7: Typical values represent most likely parametric norms for $V_{DD} = +3.3V$ and $T_A = +25^\circ C$, and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 8: Specification is guaranteed by characterization and is not tested in production.

Note 9: Output short circuit current (I_{OS}) is specified as magnitude only, minus sign indicates direction only.

Note 10: C_L includes fixture capacitance and C_D includes probe capacitance.

Note 11: The Electrical Characteristics tables list guaranteed specifications under the listed Recommended Operating Conditions except as otherwise modified or specified by the Electrical Characteristics Conditions and/or Notes.

Note 12: Typical values represent most likely parametric norms for $V_{DD} = +3.3\text{V}$ and $T_A = +25^\circ\text{C}$, and at the Recommended Operation Conditions at the time of product characterization and are not guaranteed.

Note 13: Specification is guaranteed by characterization and is not tested in production.

Note 14: t_{SKD1} , $|t_{PLHD} - t_{PHLD}|$, is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

Note 15: t_{SKD2} , Channel-to-Channel Skew, is the difference in propagation delay (t_{PLHD} or t_{PHLD}) among all output channels.

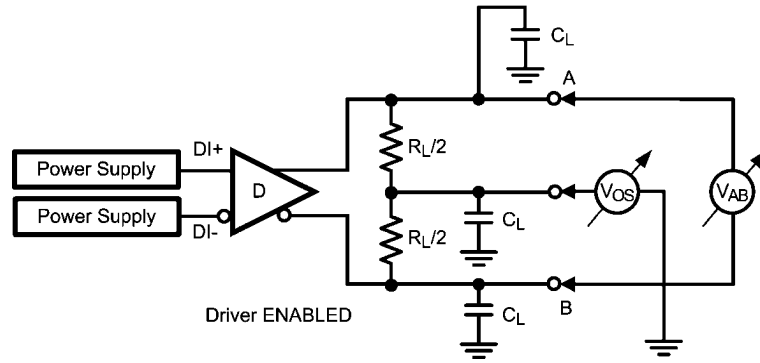

Note 16: t_{SKD3} , Part-to-Part Skew, is defined as the difference between the minimum and maximum specified differential propagation delays. This specification applies to devices at the same V_{DD} and within 5°C of each other within the operating temperature range.

Note 17: t_{SKD4} , Part-to-Part Skew, is the differential channel-to-channel skew of any event between devices. This specification applies to devices over recommended operating temperature and voltage ranges, and across process distribution. t_{SKD4} is defined as $|Max - Min|$ differential propagation delay.

Note 18: C_L includes fixture capacitance and C_D includes probe capacitance.

Note 19: Specification is guaranteed by characterization and is not tested in production.
