32-bit Audio Decoder DSP Family with Dual DSP Engine Technology

- ❑ Large On-chip X, Y, and Program RAM & ROM
- ❑ SDRAM and Serial Flash Memory Support

The CS4953xx DSP family are the enhanced versions of the CS495xx DSP family with higher overall performance and lower system cost. The CS4953xx includes all mainstream audio processing codes in on-chip ROM. This saves external memory for code storage. In addition, the intensive decoding tasks of Dolby Digital® Surround EX®, AAC multi-channel, DTS-ES 96/24, THX Ultra2 Cinema and Dolby Headphone can be accomplished without the expense of external SDRAM memory.

With larger internal memories than the CS495xx, the CS49531x is designed to support up to 150 ms per channel of lip-sync delay. With 150 MHz internal clock speed, the CS4953xx supports the most demanding post-processing requirements. It is also designed for easy upgrading. Customers currently using the CS495xx can upgrade to the CS4953xx with minor hardware and software changes.

1. Documentation Strategy

The *CS4953xx Datasheet* describes the CS4953xx family of multichannel audio decoders. This document should be used in conjunction with the following documents when evaluating or designing a system around the CS4953xx family of processors.

Table 1. CS4953xx Related Documentation

Document Name	Description
<i>CS4953xx Datasheet</i>	This document, which contains the hardware specifications for the CS4953xx family
<i>CS4953xx Hardware User's Manual</i>	Includes detailed system design information for CS4953x3 product family, including Typical Connection Diagrams, Boot-Procedures, Pin Descriptions, etc.
<i>CS4953x4/CS4970x4 System Designer's Guide</i>	A new consolidated documentation set for the CS4953x4 product family that includes: - Detailed system design information including Typical Connection Diagrams, Boot-Procedures, Pin Descriptions, Etc. Also describes use of DSP Condenser tool - Detailed firmware design information including signal processing flow diagrams and control API information
<i>AN288 - CS4953xx Firmware User's Manual</i>	Includes detailed firmware design information including signal processing flow diagrams and control API information

The scope of the *CS4953xx Datasheet* is primarily the hardware specifications of the CS4953xx family of devices. This includes hardware functionality, characteristic data, pinout, and packaging information.

The intended audience for the *CS4953xx Data Sheet* is the system PCB designer, mcu programmer, and the quality control engineer.

2. Overview

The CS4953xx DSP Family, together with Cirrus Logic's comprehensive library of audio processing algorithms enables the development of next-generation audio solutions. There are two classes of devices in the CS4953xx DSP family:

- CS4953x3 Class (ROM ID 3), comprising the CS495303 and the CS495313
- CS4953x4 Class (ROM ID 4), comprising the CS495304 and the CS495314.

The primary difference between the CS4953x3 and the CS4953x4 classes is the support of the DSP Condenser application on the CS4953x4 class of products only. DSP Condenser is a tool set that enables the DSP to automatically boot and configure itself from an external Serial FLASH, thus reducing the traditional heavy loading on the part of the system microcontroller. Because of the design time savings, enhanced tools support, and better performance associated with the CS4953x4 product set, Cirrus Logic recommends that the CS4953x4 family be used for all new designs. More information on DSP Condenser can be found in the *CS4953x4/CS497xx System Designers' Guide*.

Within each ROM ID class (3, 4), the breakdown into 2 devices per class (CS49530x, CS49531x) is based on the differences between the internal memory size and DSP Firmware supported. Essentially, the audio processing features of the CS49531x are a superset of audio features available in the CS49530x. [Table 2, "Device and Firmware Selection Guide," on page 6](#) provides details of the differences between the two product classes.

Note that the CS495303/04/14 is available in a 128-pin QFP package and the CS495313 is available in either a 128-pin or 144-pin QFP package.

2.1 Migrating from CS4953x3 to CS4953x4

- The recommended way to boot the DSP for normal operation is “master boot”. Refer to Chapter 1 of the *CS4953x4/CS4970x4 System Designer's Guide*. CS4953x4 will support slave boot mode as well (used for programming the serial flash with the DSP code, through the SCP2 port).
- CS4953x4 DSPs are only available in 128 pin package.
- The serial flash chip select pin used is pin 14 (GPIO0). Cirrus Logic recommends that at least an 8-Mbit serial Flash device be used. Refer to *CS4953x4/CS4970x4 System Designer's Guide* for a list of Flash types that are currently supported
- CS4953x4 DSP family supports DSP Condenser and DSP Manager API for run-time control/host communication. Please refer to *CS4953x4/CS4970x4 System Designer's Guide* for details.

2.2 Licensing

Licenses are required for all of the 3rd party audio decoding/processing algorithms listed below, including the application notes. Please contact your local Cirrus Sales representative for more information.

3. Code Overlays

The suite of software available for the CS4953xx family consists of an operating system (OS) and a library of overlays. The overlays have been divided into three main groups called Decoders, Mid-processors, and Post-processors. All software components are defined below:

1. *OS/Kernel* - Encompasses all non-audio processing tasks, including loading data from external memory, processing host messages, calling audio-processing subroutines, error concealment, etc.
2. *Decoders* - Any Module that initially writes data into the audio I/O buffers, e.g. AC-3®, DTS, PCM, etc. All the decoding/processing algorithms listed below require delivery of PCM or IEC61937-packed, compressed data via I²S- or LJ-formatted digital audio to the CS4953xx.
3. *Matrix-processors* - Any module that processes audio I/O buffer PCM data in-place before the Post-processors. Generally speaking, these modules alter the number of valid channels in the audio I/O buffer through processes like Virtualization ($n \Rightarrow 2$ channels) or Matrix Decoding ($2 \Rightarrow n$ channels). Examples are Dolby ProLogic IIx and DTS Neo:6.
4. *Post-processors* - Any module that processes audio I/O buffer PCM data in-place after the Mid-Processors. Examples are Bass Management, Audio Manager, Tone Control, EQ, Delay, Customer-specific Effects, Dolby Headphone/Virtual Speaker, etc.

The overlay structure reduces the time required to reconfigure the DSP when a processing change is requested. Each overlay can be reloaded independently without disturbing the other overlays. For example, when a new decoder is selected, the OS, mid-, and post-processors do not need to be reloaded — only the new decoder (the same is true for the other overlays).

[Table 2](#) below lists the firmware available based on device selection. Please refer AN288 *CS4953xx Firmware User's Manual* for the latest listing of application codes and Cirrus Framework™ modules available.

4. Hardware Functional Description

4.1 DSP Core

The CS4953xx is a dual-core DSP with separate X and Y data and P code memory spaces. Each core is a high-performance, 32-bit, user-programmable, fixed-point DSP that is capable of performing two memory access control (MAC) operations per clock cycle. Each core has eight 72-bit accumulators, four X- and four Y-data registers, and 12 index registers.

Both DSP cores are coupled to a flexible DMA engine. The DMA engine can move data between peripherals such as the digital audio input (DAI) and digital audio output (DAO), external memory, or any DSP core memory, all without the intervention of the DSP. The DMA engine offloads data move instructions from the DSP core, leaving more MIPS available for signal processing instructions.

CS4953xx functionality is controlled by application codes that are stored in on-board ROM or downloaded to the CS4953xx from a host mcu or external FLASH/EEPROM. Users can choose to use standard audio decoder and post-processor modules which are available from Cirrus Logic.

The CS4953xx is suitable for Audio Decoder, Audio Post-processor, Audio Encoder, DVD Audio/Video Player, and Digital Broadcast Decoder applications.

4.1.1 DSP Memory

Each DSP core has its own on-chip data and program RAM and ROM and does not require external memory for any of today's popular audio algorithms including Dolby Digital Surround EX, AAC Multichannel, DTS-ES 96/24, and THX Ultra2.

The memory maps for the DSPs are as follows. All memory sizes are composed of 32-bit words.

Table 3. CS49530x DSP Memory Sizes

Memory Type	DSP A	DSP B
X	16k SRAM, 16k ROM	10k SRAM, 8k ROM
Y	16k SRAM, 32k ROM	16k SRAM, 16k ROM
P	8k SRAM, 32k ROM	8k SRAM, 24k ROM

Table 4. CS49531x DSP Memory Sizes

Memory Type	DSP A	DSP B
X	16k SRAM, 16k ROM	10k SRAM, 8k ROM
Y	24k SRAM, 32k ROM	16k SRAM, 16k ROM
P	8k SRAM, 32k ROM	8k SRAM, 24k ROM

4.1.2 DMA Controller

The powerful 12-channel DMA controller can move data between 8 on-chip resources. Each resource has its own arbiter: X, Y, and P RAM/ROMs on DSP A; X, Y, and P RAM/ROMs on DSP B; external memory; and the peripheral bus. Modulo and linear addressing modes are supported, with flexible start address and increment controls. The service interval for each DMA channel as well as up to 6 interrupt events, is programmable.

4.2 On-chip DSP Peripherals

4.2.1 Digital Audio Input Port (DAI)

The 12-channel (6 line) DAI port supports a wide variety of data input formats. The port is capable of accepting PCM, IEC61937, or DSD. Up to 32-bit word lengths are supported. Up to 6 channels of DSD are supported and internally converted to PCM before processing.

The port has two independent slave-only clock domains. Each data input can be independently assigned to a clock domain. The sample rate of the input clock domains can be determined automatically by the DSP, which off-loads the task of monitoring the S/PDIF receiver from the host. A time-stamping feature allows the input data to be sample-rate converted via software.

4.2.2 Digital Audio Output Port (DAO)

There are two DAO ports. Each port can output 8 channels of up to 32-bit PCM data. The port supports data rates from 32 kHz to 192 kHz. Each port can be configured as an independent clock domain in slave mode, or the ratio of the two clocks can be set to even multiples of each other in master mode. The two ports can also be ganged together into a single clock domain. Each port has one serial audio pin that can be configured as a 192 kHz S/PDIF transmitter (data with embedded clock on a single line).

Note: Only one S/PDIF transmitter pin is available in the 128-pin package.

4.2.3 Serial Control Port 1 & 2 (I²C™ or SPI™)

There are two on-chip serial control ports that are capable of operating as master or slave in either I²C or SPI modes. SCP1 defaults to slave operation. It is dedicated for external host-control and supports an external clock up to 50 MHz in SPI mode. It is present in both the 144- and 128-pin packages. This high clock speed enables very fast code download, control or data delivery. SCP2 defaults to master mode and is dedicated for booting from external serial Flash memory or for audio sub-system control. SCP2 does not include the SCP2_BSY# pin in the 128-pin package.

4.2.4 Parallel Control Port

The CS4953xx parallel port supports both Motorola® and Intel® interfaces. It can be used for both control and data delivery. The parallel port pins are multiplexed with serial control port 2 and are available in the 144-pin package.

4.2.5 External Memory Interface

The external memory interface controller supports up to 128 Mbits of SDRAM, using a 16-bit data bus.

4.2.6 GPIO

Many of the CS4953xx peripheral pins are multiplexed with GPIO. Each GPIO can be configured as an output, an input, or an input with interrupt. Each input-pin interrupt can be configured as rising edge, falling edge, active-low, or active-high.

4.2.7 PLL-based Clock Generator

The low-jitter PLL generates integer or fractional multiples of a reference frequency which are used to clock the DSP core and peripherals. Through a second PLL divider chain, a dependent clock domain can be output on the DAO port for driving audio converters. The CS4953xx defaults to running from the external reference frequency and can be switched to use the PLL output after overlays have been loaded and configured, either through master boot from an external serial FLASH or through host control. A built-in crystal oscillator circuit with a buffered output is provided. The buffered output frequency ratio is selectable between 1:1 (default) or 2:1.

4.3 DSP I/O Description

4.3.1 Multiplexed Pins

Many of the CS4953xx pins are multi-functional. For details on pin functionality please refer to the *CS4953xx Hardware User's Manual*.

4.3.2 Termination Requirements

Open-drain pins on the CS4953xx must be pulled high for proper operation. Please refer to the *CS4953xx Hardware User's Manual* to identify which pins are open-drain and what value of pull-up resistor is required for proper operation.

Mode select pins on the CS4953xx are used to select the boot mode upon the rising edge of reset. A detailed explanation of termination requirements for each communication mode select pin can be found in the *CS4953xx Hardware User's Manual*.

4.3.3 Pads

The CS4953xx I/O operates from the 3.3 V supply and is 5V tolerant.

4.4 Application Code Security

The external program code may be encrypted by the programmer to protect any intellectual property it may contain. A secret, customer-specific key is used to encrypt the program code that is to be stored external to the device.

5. Characteristics and Specifications

Note: All data sheet minimum and maximum timing parameters are guaranteed over the rated voltage and temperature. All data sheet typical parameters are measured under the following conditions:
T = 25 °C, C_L = 20 pF, VDD = VDDA = 1.8 V, VDDIO = 3.3 V, GNDD = GNDIO = GNDA = 0 V.

5.1 Absolute Maximum Ratings

(GNDD = GNDIO = GNDA = 0 V; all voltages with respect to 0 V)

SCP_CLK rising to $\overline{\text{SCP_BSY}}$ falling	t_{spibsyf}	-	$3 \times \text{DCLKP} + 20$		ns

1. The specification f_{spisck} indicates the maximum speed of the hardware. The system designer should be aware that the actual maximum speed of the communication port may be limited by the firmware application. Flow control using the $\overline{\text{SCP_BSY}}$ pin should be implemented to prevent overflow of the input data buffer. At boot the maximum speed is $F_{\text{xtal}}/3$.

- CS4953xx has two Digital Audio Output modules having similar signal names ending in 1 and 2. Both DAO ports share a common MCLK but have independent SCLKs and LRCLKs.
- Master mode timing specifications are characterized, not production tested.
- Master mode is defined as the CS4953xx driving both DAO_SCLK, DAO_LRCLK. When MCLK is an input, it is divided to produce DAO_SCLK, DAO_LRCLK.
- This timing parameter is defined from the non-active edge of DAO_SCLK. The active edge of DAO_SCLK is the point at which the data is valid.
- Slave mode is defined as DAO_SCLK, DAO_LRCLK driven by an external source.

10. Revision History

Revision	Date	Changes
A1	FEB 2006	Advance release.
A2	JUN 2006	Updated part numbers for ordering (Tables 5 & 6), Updated V_{OH} and V_{OL} specification to include the current load used for testing
A3	JUL 2006	Updated part numbers for ordering (Tables 5 & 6). Updated text in sections 3 and 4. Updated parameter descriptions in sections 5.1 and 5.3. Updated T_{spickl} , T_{spickh} , and T_{spidov} timing. Corrected Figure SPI Master Timing to use EE_CS . Added footnote to XTI table. Removed SCLK/LRCLK relative timing from DAI port timing. Removed SCLK/LRCLK slave relative timing from DAO port timing.
A4	OCT 2007	Updated the T_{spidsu} , T_{spickl} , and T_{spickh} timing parameters for master mode SPI. This applies to both SPI ports.
PP1	May 28, 2008	Updated product feature list in Table 2 . Updated Figure 19 and Figure 21 .
PP2	June 20, 2008	Added typical crystal frequency values in Table Footnote 1 and Max and Min values of F_{xtal} in Section 5.8 . Removed DSD Phase Modulation Mode from Section 5.18 . Removed reference to MCLK in Section 5.18 . Redefined Master mode clock speed for SCP_CLK in Section 5.11 . Redefined DC leakage characterization data in Section 5.3 , correcting units of measurement. Modified Footnote 1 under Section 5.10 .
PP3	September 24, 2008	Removed references to External Parallel Flash / SRAM Interface.
PP4	June 9, 2009	Updated product number references in Section 5.9 , Section 6. , Section 7. , Table 2. , Table 3 , and Table 4 . For all Active Low pins, changed Active Low pin designation from “#” character after the pin name to a line over the pin name as in “ EE_CS ”. Removed Active Low designation from the BDI_REQ pin in the 128-pin pinout drawings in Figure 19 and Figure 20 , and in the 144-pin pinout drawings in Figure 21 and Figure 22 . Updated the pin names referred to in the timing diagrams in Figure 9 , Figure 10 , Figure 17 , and Figure 18 . Updated the parameters in Section 5.16 .
PP5	July 29, 2009	Updated Figure 19 , Figure 20 , Figure 21 . Removed CS495314-CQZ and CS495314-CQZR from Table 5 and Table 6 . Added recommendation that CS4953x4 family be used with new designs. Updated Section 2 .
