

Micropower, Rail-to-Rail Input Current Sense Amplifier with Voltage Output

ISL28005

The ISL28005 is a micropower, uni-directional high-side and low-side current sense amplifier featuring a proprietary rail-to-rail input current sensing amplifier. The ISL28005 is ideal for high-side current sense applications where the sense voltage is usually much higher than the amplifier supply voltage. The device can be used to sense voltages as high as 28V when operating from a supply voltage as low as 2.7V. The micropower ISL28005 consumes only 50µA of supply current when operating from a 2.7V to 28V supply.

The ISL28005 features a common-mode input voltage range from 0V to 28V. The proprietary architecture extends the input voltage sensing range down to 0V, making it an excellent choice for low-side ground sensing applications. The benefit of this architecture is that a high degree of total output accuracy is maintained over the entire 0V to 28V common mode input voltage range.

The ISL28005 is available in fixed (100V/V, 50V/V and 20V/V) gains in the space saving 5 Ld SOT-23 package. The parts operate over the extended temperature range from -40°C to +125°C.

Features

- Low Power Consumption. 50µA,Typ
- Supply Range 2.7V to 28V
- Wide Common Mode Input. 0V to 28V
- Fixed Gain Versions
 - ISL28005-100 100V/V
 - ISL28005-50 50V/V
 - ISL28005-20 20V/V
- Operating Temperature Range. -40°C to +125°C
- Package. 5 Ld SOT-23

Applications

- Power Management/Monitors
- Power Distribution and Safety
- DC/DC, AC/DC Converters
- Battery Management /Charging
- Automotive Power Distribution

NOTES:

1. Please refer to [TB347](#) for details on reel specifications.
2. These Intersil Pb-free plastic packaged products employ special Pb-free material sets, molding compounds/die attach materials, and 100% matte tin plate plus anneal (e3 termination finish, which is RoHS compliant and compatible with both SnPb and Pb-free soldering operations). Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.
3. For Moisture Sensitivity Level (MSL), please see device information page for [ISL28005](#). For more information on MSL please see techbrief [TB363](#).
4. The part marking is located on the bottom of the part.

Absolute Maximum Ratings

Max Supply Voltage	28V
Max Differential Input Current	20mA
Max Differential Input Voltage	±0.5V
Max Input Voltage (RS+, RS-)	GND-0.5V to 30V
Max Input Current for Input Voltage <GND -0.5V	±20mA
Output Short-Circuit Duration	Indefinite
ESD Rating	
Human Body Model	4kV
Machine Model	200V
Charged Device Model	1.5kV

Thermal Information

NOTES:

7. Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.

8. DEFINITION OF TERMS:

- $V_{SENSE A} = V_{SENSE} @ 100mV$
- $V_{SENSE B} = V_{SENSE} @ 20mV$
- $V_{OUT A} = V_{OUT} @ V_{SENSE A} = 100mV$
- $V_{OUT B} = V_{OUT} @ V_{SENSE B} = 20mV$

$$\bullet G = GAIN = \left(\frac{V_{OUT A} - V_{OUT B}}{V_{SENSE A} - V_{SENSE B}} \right)$$

9. V_{OS} is extrapolated from the gain measurement. $V_{OS} = V_{SENSE A} - \frac{V_{OUT A}}{G}$

$$10. \% \text{ Gain Accuracy} = G_A = \left(\frac{G_{MEASURED} - G_{EXPECTED}}{G_{EXPECTED}} \right) \times 100$$

$$11. \text{ Output Accuracy } \% V_{OA} = \left(\frac{V_{OUT MEASURED} - V_{OUT EXPECTED}}{V_{OUT EXPECTED}} \right) \times 100 \text{ where } V_{OUT} = V_{SENSE} \times GAIN \text{ and } V_{SENSE} = 100mV$$

Typical Performance Curves $V_{CC} = 12V$, $R_L = 1M$, unless otherwise specified.

Applications Information

Functional Description

The ISL28005-20, ISL28005-50 and ISL28005-100 are single supply, uni-directional current sense amplifiers with fixed gains of 20V/V, 50V/V and 100V/V respectively.

The ISL28005 is a 2-stage amplifier. Figure 18 shows the active circuitry for high-side current sense applications where the sense voltage is between 1.35V to 28V. Figure 19 shows the active circuitry for ground sense applications where the sense voltage is between 0V to 1.35V.

The first stage is a bi-level trans-conductance amp and level translator. The g_m stage converts the low voltage drop (V_{SENSE}) sensed across an external milli-ohm sense resistor, to a current (@ $g_m = 21.3\mu A/V$). The trans-conductance amplifier forces a current through R_1 resulting to a voltage drop across R_1 that is equal to the sense voltage (V_{SENSE}). The current through R_1 is mirrored across R_5 creating a ground-referenced voltage at the input of the second amplifier equal to V_{SENSE} .

The second stage is responsible for the overall gain and frequency response performance of the device. The fixed gains (20, 50, 100) are set with internal resistors R_f and R_g . The only external component needed is a current sense resistor (typically 0.001 Ω to 0.01 Ω , 1W to 2W).

The transfer function is given in Equation 1.

$$V_{OUT} = GAIN \times (I_S R_S + V_{OS}) \quad (EQ. 1)$$

The input g_m stage derives its ~2.86 μA supply current from the input source through the $RS+$ terminal as long as the sensed voltage at the $RS+$ pin is >1.35V and the gm_{HI} amplifier is selected. When the sense voltage at $RS+$ drops below the 1.35V threshold, the gm_{LO} amplifier kicks in and the gm_{LO} output current reverses, flowing out of the $RS-$ pin.

FIGURE 18. HIGH-SIDE CURRENT DETECTION

FIGURE 19. LOW-SIDE CURRENT DETECTION

Hysteretic Comparator

The input trans-conductance amps are under control of a hysteretic comparator operating from the incoming source voltage on the RS+ pin (see Figure 20). The comparator monitors the voltage on RS+ and switches the sense amplifier from the low-side gm amp to the high-side gm amplifier whenever the input voltage at RS+ increases above the 1.35V threshold. Conversely, a decreasing voltage on the RS+ pin, causes the hysteric comparator to switch from the high-side gm amp to the low-side gm amp as the voltage decreases below 1.35V. It is that low-side sense gm amplifier that gives the ISL28005 the proprietary ability to sense current all the way to 0V. Negative voltages on the RS+ or RS- are beyond the sensing voltage range of this amplifier.

FIGURE 20. GAIN ACCURACY vs $V_{RS+} = 0V$ TO $2V$

Typical Application Circuit

Figure 22 shows the basic application circuit and optional protection components for switched-load applications. For applications where the load and the power source is permanently connected, only an external sense resistor is needed. For applications where fast transients are caused by hot plugging the source or load, external protection components may be needed. The external current limiting resistor (R_P) in Figure 22 may be required to limit the peak current through the internal ESD diodes to $< 20mA$. This condition can occur in applications that experience high levels of in-rush current causing high peak voltages that can damage the internal ESD diodes. An R_P resistor value of 100Ω will provide protection for a $2V$ transient with the

maximum of $20mA$ flowing through the input while adding only an additional $13\mu V$ (worse case over-temperature) of V_{OS} . Refer to the following formula:

$$((R_P \times I_{RS-}) = (100\Omega \times 130nA) = 13\mu V)$$

Switching applications can generate voltage spikes that can overdrive the amplifier input and drive the output of the amplifier into the rails, resulting in a long overload recovery time. Capacitors C_M and C_D filter the common mode and differential voltage spikes.

Error Sources

There are 3 dominant error sources: gain error, input offset voltage error and Kelvin voltage error (see Figure 21). The gain error is dominated by the internal resistance matching tolerances. The remaining errors appear as sense voltage errors at the input to the amplifier. They are V_{OS} of the amplifier and Kelvin voltage errors. If the transient protection resistor is added, an additional V_{OS} error can result from the $I_x R$ voltage due to input bias current. The limiting resistor should only be added to the RS- input, due to the high-side gm amplifier (gm_{HI}) sinking several micro amps of current through the RS+ pin.

Layout Guidelines

Kelvin Connected Sense Resistor

The source of Kelvin voltage errors is illustrated in Figure 21. The resistance of $1/2$ oz. copper is $\sim 1m\Omega$ per square with a TC of $\sim 3900ppm/^{\circ}C$ ($0.39\%/^{\circ}C$). When you compare this unwanted parasitic resistance with the total of $1m\Omega$ to $10m\Omega$ resistance of the sense resistor, it is easy to see why the sense connection must be chosen very carefully. For example, consider a maximum current of $20A$ through a 0.005Ω sense resistor, generating a $V_{SENSE} = 0.1$ and a full scale output voltage of $10V$ ($G = 100$). Two side contacts of only 0.25 square per contact puts the V_{SENSE} input about $0.5 \times 1m\Omega$ away from the resistor end capacitor. If only $10A$ the $20A$ total current flows through the kelvin path to the resistor, you get an error voltage of $10mV$ ($10A \times 0.5sq \times 0.001\Omega/sq. = 10mV$) added to the $100mV$ sense voltage for a sense voltage error of 10% $(0.110V - 0.1)/0.1V \times 100$.

FIGURE 21. PC BOARD CURRENT SENSE KELVIN CONNECTION

FIGURE 22. TYPICAL APPLICATION CIRCUIT

Overall Accuracy (V_{OA} %)

V_{OA} is defined as the total output accuracy Referred-to-Output (RTO). The output accuracy contains all offset and gain errors, at a single output voltage. Equation 2 is used to calculate the % total output accuracy.

$$V_{OA} = 100 \times \left(\frac{V_{OUT\text{actual}} - V_{OUT\text{expected}}}{V_{OUT\text{expected}}} \right) \quad (\text{EQ. 2})$$

where

$$V_{OUT\text{Actual}} = V_{SENSE} \times \text{GAIN}$$

Example: Gain = 100, For 100mV V_{SENSE} input we measure 10.1V. The overall accuracy (V_{OA}) is 1% as shown in Equation 3.

$$V_{OA} = 100 \times \left(\frac{10.1 - 10}{10} \right) = 1\text{percent} \quad (\text{EQ. 3})$$

Power Dissipation

It is possible to exceed the +150°C maximum junction temperatures under certain load and power supply conditions. It is therefore important to calculate the maximum junction temperature (T_{JMAX}) for all applications to determine if power supply voltages, load conditions, or package type need to be modified to remain in the safe operating area. These parameters are related using Equation 4:

$$T_{JMAX} = T_{MAX} + \theta_{JA} \times PD_{MAXTOTAL} \quad (\text{EQ. 4})$$

where:

- $PD_{MAXTOTAL}$ is the sum of the maximum power dissipation of each amplifier in the package (PD_{MAX})
- PD_{MAX} for each amplifier can be calculated using Equation 5:

$$PD_{MAX} = V_S \times I_{qMAX} + (V_S - V_{OUTMAX}) \times \frac{V_{OUTMAX}}{R_L} \quad (\text{EQ. 5})$$

where:

- T_{MAX} = Maximum ambient temperature
- θ_{JA} = Thermal resistance of the package
- PD_{MAX} = Maximum power dissipation of 1 amplifier
- V_{CC} = Total supply voltage
- I_{qMAX} = Maximum quiescent supply current of 1 amplifier
- V_{OUTMAX} = Maximum output voltage swing of the application
- R_L = Load resistance

Revision History

The revision history provided is for informational purposes only and is believed to be accurate, but not warranted. Please go to web to make sure you have the latest Rev.

DATE	REVISION	CHANGE
4/11/11	FN6973.4	Corrected location of the load in Figure 19. Moved Load from the ground side of the input sense circuit to the high side of the voltage source Updated note in Min Max column of spec table from "Parameters with MIN and/or MAX limits are 100% tested at +25 °C, unless otherwise specified. Temperature limits established by characterization and are not production tested." to "Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design."
9/2/10	FN6973.3	Added -T7A tape and reel package options to Ordering Information Table for all packages.
5/12/10	FN6973.2	Added Note 4 to Part Marking Column in "Ordering Information" on page 3. Corrected hyperlinks in Notes 1 and 3 in "Ordering Information" on page 3. Corrected ISL28005 hyperlink in "Products" on page 13.
4/12/10		Added Eval boards to ordering info.
4/7/10		Added "Related Literature" on page 1 Updated Package Drawing Number in the "Ordering Information" on page 3 from MDP0038 to P50.64A. Revised package outline drawing from MDP0038 to P5.064A on page 14. MDP0038 package contained 2 packages for both the 5 and 6 Ld SOT-23. MDP0038 was obsoleted and the packages were separated and made into 2 separate package outline drawings; P5.064A and P6.064A. Changes to the 5 Ld SOT-23 were to move dimensions from table onto drawing, add land pattern and add JEDEC reference number.
2/3/10	FN6973.1	-Page1: Edited last sentence of paragraph 2. Moved order of GAIN listings from 20, 50, 100 to 100, 50, 20 in the 3rd paragraph. Under Featuresremoved "Low Input Offset Voltage 250µV,max" Under Features moved order of parts listing from 20, 50, 100 (from top to bottom) to 100, 50, 20. -Page 3: Removed coming soon on ISL28005FH50Z and ISL28005FH20Z and changes the order or listing them to 100, 50, 20. -Page 5: VOA test. Under conditions column ...deleted "20mV to". It now reads ... Vsense = 100mV SR test. Under conditions column ..deleted what was there. It now reads ... Pulse on RS+pin, See Figure 17 -Page 6: ts test. Removed Gain = 100 and Gain = 100V/V in both description and conditions columns respectively. -Page 9 Added Figure 17 and adjusted figure numbers to account for the added figure.
12/14/09	FN6973.0	Initial Release

Products

Intersil Corporation is a leader in the design and manufacture of high-performance analog semiconductors. The Company's products address some of the industry's fastest growing markets, such as, flat panel displays, cell phones, handheld products, and notebooks. Intersil's product families address power management and analog signal processing functions. Go to www.intersil.com/products for a complete list of Intersil product families.

*For a complete listing of Applications, Related Documentation and Related Parts, please see the respective device information page on intersil.com: [ISL28005](http://www.intersil.com/ISL28005)
