

60-V, 5- μ A I_Q , 100-mA, Low-Dropout VOLTAGE REGULATOR with Enable and Power-Good

Check for Samples: [TPS7A16](#)

FEATURES

- **Wide Input Voltage Range:** 3 V to 60 V
- **Ultralow Quiescent Current:** 5 μ A
- **Quiescent Current at Shutdown:** 1 μ A
- **Output Current:** 100 mA
- **Low Dropout Voltage:** 60 mV at 20 mA
- **Accuracy:** 2%
- **Available in:**
 - **Fixed Output Voltage:** 3.3 V, 5.0 V
 - **Adjustable Version** from ~1.2 V to 18.5 V
- **Power Good with Programable Delay**
- **Current-Limit and Thermal Shutdown Protections**
- **Stable with Ceramic Output Capacitors:** $\geq 2.2 \mu$ F
- **Package:** High Thermal Performance MSOP-8 PowerPAD™
- **Operating Temperature Range:** -40°C to $+125^\circ\text{C}$

APPLICATIONS

- **High Cell-Count Battery Packs for Power Tools and other Battery-Powered Microprocessor and Microcontroller Systems**
- **Car Audio, Navigation, Infotainment, and Other Automotive Systems**
- **Power Supplies for Notebook PCs, Digital TVs, and Private LAN Systems**
- **Smoke/ CO_2 Detectors and Battery-Powered Alarm/Security Systems**

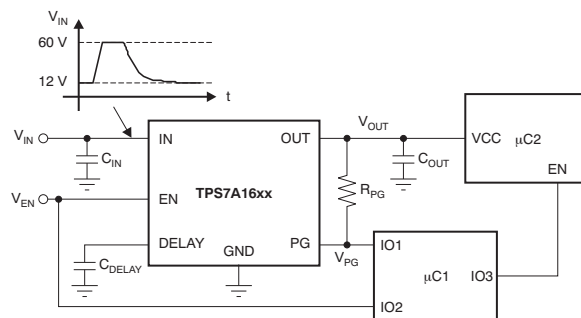

DESCRIPTION

The TPS7A16 family of ultra-low power, low-dropout (LDO) voltage regulators offers the benefits of ultra-low quiescent current, high input voltage and miniaturized, high thermal-performance packaging.

The TPS7A16 family is designed for continuous or sporadic (power backup) battery-powered applications where ultra-low quiescent current is critical to extending system battery life.

The TPS7A16 family offers an enable pin (EN) compatible with standard CMOS logic and an integrated open drain active-high power good output (PG) with a user-programmable delay. These pins are intended for use in microcontroller-based, battery-powered applications where power-rail sequencing is required.

In addition, the TPS7A16 is ideal for generating a low-voltage supply from multicell solutions ranging from high cell-count power-tool packs to automotive applications; not only can this device supply a well-regulated voltage rail, but it can also withstand and maintain regulation during voltage transients. These features translate to simpler and more cost-effective, electrical surge-protection circuitry.

Low Power Microcontroller Rail Sequencing in Automotive Applications Subject to Load Dump Transient

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

V_{DO}	Dropout voltage	$V_{IN} = 4.5\text{ V}$, $V_{OUT(NOM)} = 5\text{ V}$, $I_{OUT} = 20\text{ mA}$	60			mV
		$V_{IN} = 4.5\text{ V}$, $V_{OUT(NOM)} = 5\text{ V}$, $I_{OUT} = 100\text{ mA}$	265			500
I_{LIM}	Current limit	$V_{OUT} = 90\% V_{OUT(NOM)}$, $V_{IN} = 3.0\text{ V}$	101	225	400	mA
I_{GND}	Ground current	$3\text{ V} \leq V_{IN} \leq 60\text{ V}$, $I_{OUT} = 10\text{ }\mu\text{A}$	5.0			15
		$I_{OUT} = 100\text{ mA}$	5.0			μA
I_{SHDN}	Shutdown supply current	$V_{EN} = +0.4\text{ V}$	0.59			5.0
I_{FB}	Feedback current ⁽²⁾		-1.0	0.0	1.0	μA
I_{EN}	Enable current	$3\text{ V} \leq V_{IN} \leq 12\text{ V}$, $V_{IN} = V_{EN}$	-1.0	0.01	1.0	μA
V_{EN_HI}	Enable high-level voltage		1.2			V
V_{EN_LO}	Enable low-level voltage		0.3			V
V_{IT}	PG trip threshold	OUT pin floating, V_{FB} increasing, $V_{IN} \geq V_{IN_MIN}$	85%			95%
		OUT pin floating, V_{FB} decreasing, $V_{IN} \geq V_{IN_MIN}$	83%			93%
V_{HYS}	PG trip hysteresis		2.3%			4%
V_{PG_LO}	PG output low voltage	OUT pin floating, $V_{FB} = 80\% V_{REF}$, $I_{PG} = 1\text{ mA}$	0.4			V
I_{PG_LKG}	PG leakage current	$V_{PG} = V_{OUT(NOM)}$	-1.0			1.0
I_{DELAY}	DELAY pin current		1.0			2.0
PSRR	Power-supply rejection ratio	$V_{IN} = 3\text{ V}$, $V_{OUT(NOM)} = V_{REF}$, $C_{OUT} = 10\text{ }\mu\text{F}$, $f = 100\text{ Hz}$	50			dB
T_{SD}	Thermal shutdown temperature	Shutdown, temperature increasing	+170			$^{\circ}\text{C}$
		Reset, temperature decreasing	+150			$^{\circ}\text{C}$
T_J	Operating junction temperature range		-40			+125

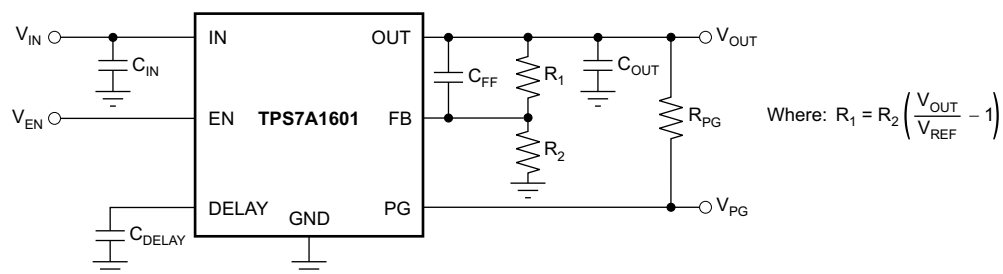

- (1) Maximum input voltage is limited to 24 V because of the package power dissipation limitations at full load ($P \approx (V_{IN} - V_{OUT}) \times I_{OUT} = (24\text{ V} - V_{REF}) \times 50\text{ mA} \approx 1.14\text{ W}$). The device is capable of sourcing a maximum current of 50 mA at higher input voltages as long as the power dissipated is within the thermal limits of the package plus any external heatsinking.
- (2) $I_{FB} > 0$ flows out of the device.

DEVICE INFORMATION

FUNCTIONAL BLOCK DIAGRAM

TYPICAL APPLICATION CIRCUIT

TPS7A1601 Circuit as an Adjustable Regulator

PIN CONFIGURATION

DGN PACKAGE MSOP-8 (TOP VIEW)

PIN DESCRIPTIONS

TPS7A16xx		DESCRIPTION
NAME	NO.	
DELAY	7	Delay pin. Connect a capacitor to GND to adjust the PG delay time; leave open if the reset function is not needed.
EN	5	Enable pin. This pin turns the regulator on or off. If $V_{EN} \geq V_{EN_HI}$, the regulator is enabled. If $V_{EN} \leq V_{EN_LO}$, the regulator is disabled. If not used, the EN pin can be connected to IN. Make sure that $V_{EN} \leq V_{IN}$ at all times.
FB/DNC	2	For the adjustable version (TPS7A1601), the feedback pin is the input to the control-loop error amplifier. This pin is used to set the output voltage of the device when the regulator output voltage is set by external resistors. For the fixed voltage versions: DO NOT CONNECT to this pin. Do not route this pin to any electrical net, not even GND or IN.
GND	4	Ground pin.
IN	8	Regulator input supply pin. A capacitor $> 0.1 \mu F$ must be tied from this pin to ground to assure stability. It is recommended to connect a $10 \mu F$ ceramic capacitor from IN to GND (as close to the device as possible) to reduce circuit sensitivity to printed-circuit-board (PCB) layout, especially when long input tracer or high source impedances are encountered.
NC	6	This pin can be left open or tied to any voltage between GND and IN.
OUT	1	Regulator output pin. A capacitor $> 2.2 \mu F$ must be tied from this pin to ground to assure stability. It is recommended to connect a $10 \mu F$ ceramic capacitor from OUT to GND (as close to the device as possible) to maximize AC performance.
PG	3	Power-good pin. Open collector output; leave open or connect to GND if the power-good function is not needed.
PowerPAD		Solder to printed circuit board (PCB) to enhance thermal performance. Although it can be left floating, it is highly recommended to connect the PowerPAD to the GND plane.

TYPICAL CHARACTERISTICS

At $T_J = -40^\circ\text{C}$ to $+125^\circ\text{C}$, $V_{IN} = V_{OUT(NOM)} + 0.5\text{ V}$ or $V_{IN} = 3.0\text{ V}$ (whichever is greater), $V_{EN} = V_{IN}$, $I_{OUT} = 10\text{ }\mu\text{A}$, $C_{IN} = 1\text{ }\mu\text{F}$, $C_{OUT} = 2.2\text{ }\mu\text{F}$, and FB tied to OUT, unless otherwise noted.

Figure 13.

THEORY OF OPERATION

GENERAL DESCRIPTION

The TPS7A16 family of ultra-low power voltage regulators offers the benefit of ultra-low quiescent current, high input voltage, and miniaturized, high thermal-performance packaging.

The TPS7A16 family is designed for continuous or sporadic (power backup) battery-operated applications where ultra-low quiescent current is critical to extending system battery life.

ADJUSTABLE VOLTAGE OPERATION

The TPS7A1601 has an output voltage range from 1.194 V to 20 V. The nominal output of the device is set by two external resistors, as shown in [Figure 14](#):

Figure 14. Adjustable Operation

R_1 and R_2 can be calculated for any output voltage range using the formula shown in [Equation 1](#):

$$R_1 = R_2 \left(\frac{V_{OUT}}{V_{REF}} - 1 \right) \quad (1)$$

Resistor Selection

It is recommended to use resistors in the order of MΩ to keep the overall quiescent current of the system as low as possible (by making the current used by the resistor divider negligible compared to the device's quiescent current).

If greater voltage accuracy is required, take into account the voltage offset contributions as a result of feedback current and use of 0.1% tolerance resistors.

[Table 1](#) shows the resistor combination to achieve a few of the most common rails using commercially available 0.1% tolerance resistors to maximize nominal voltage accuracy, while abiding to the formula shown in [Equation 1](#).

Table 1. Selected Resistor Combinations

V_{OUT}	R_1	R_2	$V_{OUT}/(R_1 + R_2) \ll I_Q$	NOMINAL ACCURACY
1.194 V	0 Ω	∞	0 μA	$\pm 2\%$
1.8 V	1.18 M Ω	2.32 M Ω	514 nA	$\pm(2\% + 0.14\%)$
2.5 V	1.5 M Ω	1.37 M Ω	871 nA	$\pm(2\% + 0.16\%)$
3.3 V	2 M Ω	1.13 M Ω	1056 nA	$\pm(2\% + 0.35\%)$
5 V	3.4 M Ω	1.07 M Ω	1115 nA	$\pm(2\% + 0.39\%)$
10 V	7.87 M Ω	1.07 M Ω	1115 nA	$\pm(2\% + 0.42\%)$
12 V	14.3 M Ω	1.58 M Ω	755 nA	$\pm(2\% + 0.18\%)$
15 V	42.2 M Ω	3.65 M Ω	327 nA	$\pm(2\% + 0.19\%)$
18 V	16.2 M Ω	1.15 M Ω	1038 nA	$\pm(2\% + 0.26\%)$

Close attention must be paid to board contamination when using high-value resistors; board contaminants may significantly impact voltage accuracy. If board cleaning measures cannot be ensured, consider using a fixed-voltage version of the TPS7A16 or using resistors in the order of hundreds or tens of k Ω .

CAPACITOR RECOMMENDATIONS

Low equivalent series resistance (ESR) capacitors should be used for the input, output, and feed-forward capacitors. Ceramic capacitors with X7R and X5R dielectrics are preferred. These dielectrics offer more stable characteristics. Ceramic X7R capacitors offer improved over-temperature performance, while ceramic X5R capacitors are the most cost-effective and are available in higher values.

Note that high ESR capacitors may degrade PSRR.

INPUT AND OUTPUT CAPACITOR REQUIREMENTS

The TPS7A16 family of ultra-low power, high-voltage linear regulators achieves stability with a minimum input capacitance of 0.1 μF and output capacitance of 2.2 μF ; however, it is recommended to use a 10- μF ceramic capacitor to maximize ac performance.

POWER-GOOD

The power-good (PG) pin is an open-drain output and can be connected to any 5.5-V or lower rail through an external pull-up resistor. When no C_{DELAY} is used, the PG output is high-impedance when V_{OUT} is greater than the PG trip threshold (V_{IT}). If V_{OUT} drops below V_{IT} , the open-drain output turns on and pulls the PG output low. If output voltage monitoring is not needed, the PG pin can be left floating or connected to GND.

The power-good feature functionality is only guaranteed when $V_{IN} \geq 3V$ (V_{IN_MIN}).

Power-Good Delay and Delay Capacitor

The power-good delay time (t_{DELAY}) is defined as the time period from when V_{OUT} exceeds the PG trip threshold voltage (V_{IT}) to when the PG output is high. This power-good delay time is set by an external capacitor (C_{DELAY}) connected from the DELAY pin to GND; this capacitor is charged from 0 V to ~ 1.8 V by the DELAY pin current (I_{DELAY}) once V_{OUT} exceeds the PG trip threshold (V_{IT}).

When C_{DELAY} is used, the PG output is high-impedance when V_{OUT} exceeds V_{IT} , and V_{DELAY} exceeds V_{REF} .

The power-good delay time can be calculated using: $t_{DELAY} = (C_{DELAY} \times V_{REF})/I_{DELAY}$. For example, when $C_{DELAY} = 10$ nF, the PG delay time is approximately 12ms; that is, $(10 \text{ nF} \times 1.193 \text{ V})/1 \mu A = 11.93 \text{ ms}$.

FEED-FORWARD CAPACITOR

Although a feed-forward capacitor (C_{FF}) from OUT to FB is not needed to achieve stability, it is recommended to use a 0.01- μF feed-forward capacitor to maximize ac performance.

TRANSIENT RESPONSE

As with any regulator, increasing the size of the output capacitor reduces over/undershoot magnitude but increases the duration of the transient response.

APPLICATION INFORMATION

AUTOMOTIVE APPLICATIONS

The TPS7A16 family maximum input voltage of 60 V makes it ideal for use in automotive applications where high-voltage transients are present.

Events such as load-dump overvoltage (where the battery is disconnected while the alternator is providing current to a load) may cause voltage spikes from 25 V to 60 V. In order to prevent any damage to sensitive circuitry, local transient voltage suppressors can be used to cap voltage spikes to lower, more manageable voltages.

The TPS7A16 family can be used to simplify and lower costs in such cases. The TPS7A16 very high voltage range allows this regulator to not only withstand the voltages coming out of these local transient voltage suppressors, but even replace them, thus lowering system cost and complexity.

Figure 15. Low-Power Microcontroller Rail Sequencing in Automotive Applications Subjected to Load-Dump Transients

MULTICELL BATTERY PACKS

Currently, battery packs can employ up to a dozen cells in series that, when fully charged, may have voltages of up to 55 V. Internal circuitry in these battery packs is used to prevent overcurrent and overvoltage conditions that may degrade battery life or even pose a safety risk; this internal circuitry is often managed by a low-power microcontroller, such as TI's [MSP430](#).

The microcontroller continuously monitors the battery itself, whether the battery is in use or not. Although this microcontroller could be powered by an intermediate voltage taken from the multicell array, this approach unbalances the battery pack itself, degrading its life or adding cost to implement more complex cell balancing topologies.

The best approach to power this microcontroller is to regulate down the voltage from the entire array to discharge every cell equally and prevent any balancing issues. This approach reduces system complexity and cost.

TPS7A16 is the ideal regulator for this application because it can handle very high voltages (from the entire multicell array) and has very low quiescent current (to maximize battery life).

Figure 16. Protection Based on Low-Power Microcontroller Power from Multicell Battery Packs

BATTERY-OPERATED POWER TOOLS

High voltage multicell battery packs support high-power applications, such as power tools, with high current drain when in use, highly intermittent use cycles, and physical separation between battery and motor.

In these applications, a microcontroller or microprocessor controls the motor. This microcontroller must be powered with a low-voltage rail coming from the high-voltage, multicell battery pack; as mentioned previously, powering this microcontroller or microprocessor from an intermediate voltage from the multicell array causes battery-pack life degradation or added system complexity because of cell balancing issues. In addition, this microcontroller or microprocessor must be protected from the high-voltage transients because of the motor inductance.

The TPS7A16 can be used to power the motor-controlled microcontroller or microprocessor; its low quiescent current maximizes battery shelf life and its very high-voltage capabilities simplify system complexity by replacing voltage suppression filters, thus lowering system cost.

Figure 17. Low Power Microcontroller Power From Multi-cell Battery Packs In Power Tools

LAYOUT

PACKAGE MOUNTING

Solder pad footprint recommendations for the TPS7A16 are available at the end of this product data sheet and at www.ti.com.

BOARD LAYOUT RECOMMENDATIONS TO IMPROVE PSRR AND NOISE PERFORMANCE

To improve ac performance such as PSRR, output noise, and transient response, it is recommended that the board be designed with separate ground planes for IN and OUT, with each ground plane connected only at the GND pin of the device. In addition, the ground connection for the output capacitor should connect directly to the GND pin of the device.

Equivalent series inductance (ESL) and ESR must be minimized in order to maximize performance and ensure stability. Every capacitor must be placed as close as possible to the device and on the same side of the PCB as the regulator itself.

Do not place any of the capacitors on the opposite side of the PCB from where the regulator is installed. The use of vias and long traces is strongly discouraged because they may impact system performance negatively and even cause instability.

If possible, and to ensure the maximum performance denoted in this product data sheet, use the same layout pattern used for TPS7A16 evaluation board, available at www.ti.com.

Additional Layout Considerations

The high impedance of the FB pin makes the regulator sensitive to parasitic capacitances that may couple undesirable signals from near-by components (specially from logic and digital ICs, such as microcontrollers and microprocessors); these capacitively-coupled signals may produce undesirable output voltage transients. In these cases, it is recommended to use a fixed-voltage version of the TPS7A16, or isolate the FB node by flooding the local PCB area with ground-plane copper to minimize any undesirable signal coupling.

THERMAL PROTECTION

Thermal protection disables the output when the junction temperature rises to approximately +170°C, allowing the device to cool. When the junction temperature cools to approximately +150°C, the output circuitry is enabled. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the dissipation of the regulator, protecting it from damage as a result of overheating.

Any tendency to activate the thermal protection circuit indicates excessive power dissipation or an inadequate heat spreading area. For reliable operation, junction temperature should be limited to a maximum of +125°C at the worst case ambient temperature for a given application. To estimate the margin of safety in a complete design (including the copper heat-spreading area), increase the ambient temperature until the thermal protection is triggered; use worst-case loads and signal conditions. For good reliability, thermal protection should trigger at least +45°C above the maximum expected ambient condition of the particular application. This configuration produces a worst-case junction temperature of +125°C at the highest expected ambient temperature and worst-case load.

The internal protection circuitry of the TPS7A16 has been designed to protect against overload conditions. It was not intended to replace proper heatsinking. Continuously running the TPS7A16 into thermal shutdown degrades device reliability.

POWER DISSIPATION

The ability to remove heat from the die is different for each package type, presenting different considerations in the PCB layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat dissipating layers also improves the heatsink effectiveness.

Power dissipation depends on input voltage and load conditions. Power dissipation (P_D) is equal to the product of the output current times the voltage drop across the output pass element, as shown in [Equation 2](#):

$$P_D = (V_{IN} - V_{OUT}) I_{OUT} \quad (2)$$

SUGGESTED LAYOUT AND SCHEMATIC

Layout is a critical part of good power-supply design. There are several signal paths that conduct fast-changing currents or voltages that can interact with stray inductance or parasitic capacitance to generate noise or degrade the power-supply performance. To help eliminate these problems, the IN pin should be bypassed to ground with a low ESR ceramic bypass capacitor with a X5R or X7R dielectric.

It may be possible to obtain acceptable performance with alternative PCB layouts; however, the layout and the schematic have been shown to produce good results and are meant as a guideline.

Figure 18 shows the schematic for the suggested layout. Figure 19 and Figure 20 show the top and bottom printed circuit board (PCB) layers for the suggested layout.

⁽¹⁾ The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

⁽²⁾ Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

⁽³⁾ MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

PowerPAD™ PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Body dimensions do not include mold flash or protrusion.
 - This package is designed to be soldered to a thermal pad on the board. Refer to Technical Brief, PowerPad Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 for information regarding recommended board layout. This document is available at www.ti.com <<http://www.ti.com>>.
 - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.
 - Falls within JEDEC MO-187 variation AA-T

PowerPAD is a trademark of Texas Instruments.

PowerPAD™ PLASTIC SMALL OUTLINE

THERMAL INFORMATION

This PowerPAD™ package incorporates an exposed thermal pad that is designed to be attached to a printed circuit board (PCB). The thermal pad must be soldered directly to the PCB. After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For additional information on the PowerPAD package and how to take advantage of its heat dissipating abilities, refer to Technical Brief, PowerPAD Thermally Enhanced Package, Texas Instruments Literature No. SLMA002 and Application Brief, PowerPAD Made Easy, Texas Instruments Literature No. SLMA004. Both documents are available at www.ti.com.

The exposed thermal pad dimensions for this package are shown in the following illustration.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
